Computer Networks

Subnet, Subnet Mask, Routing

UNDERSTANDING SUBNETTING WITH AN EXAMPLE

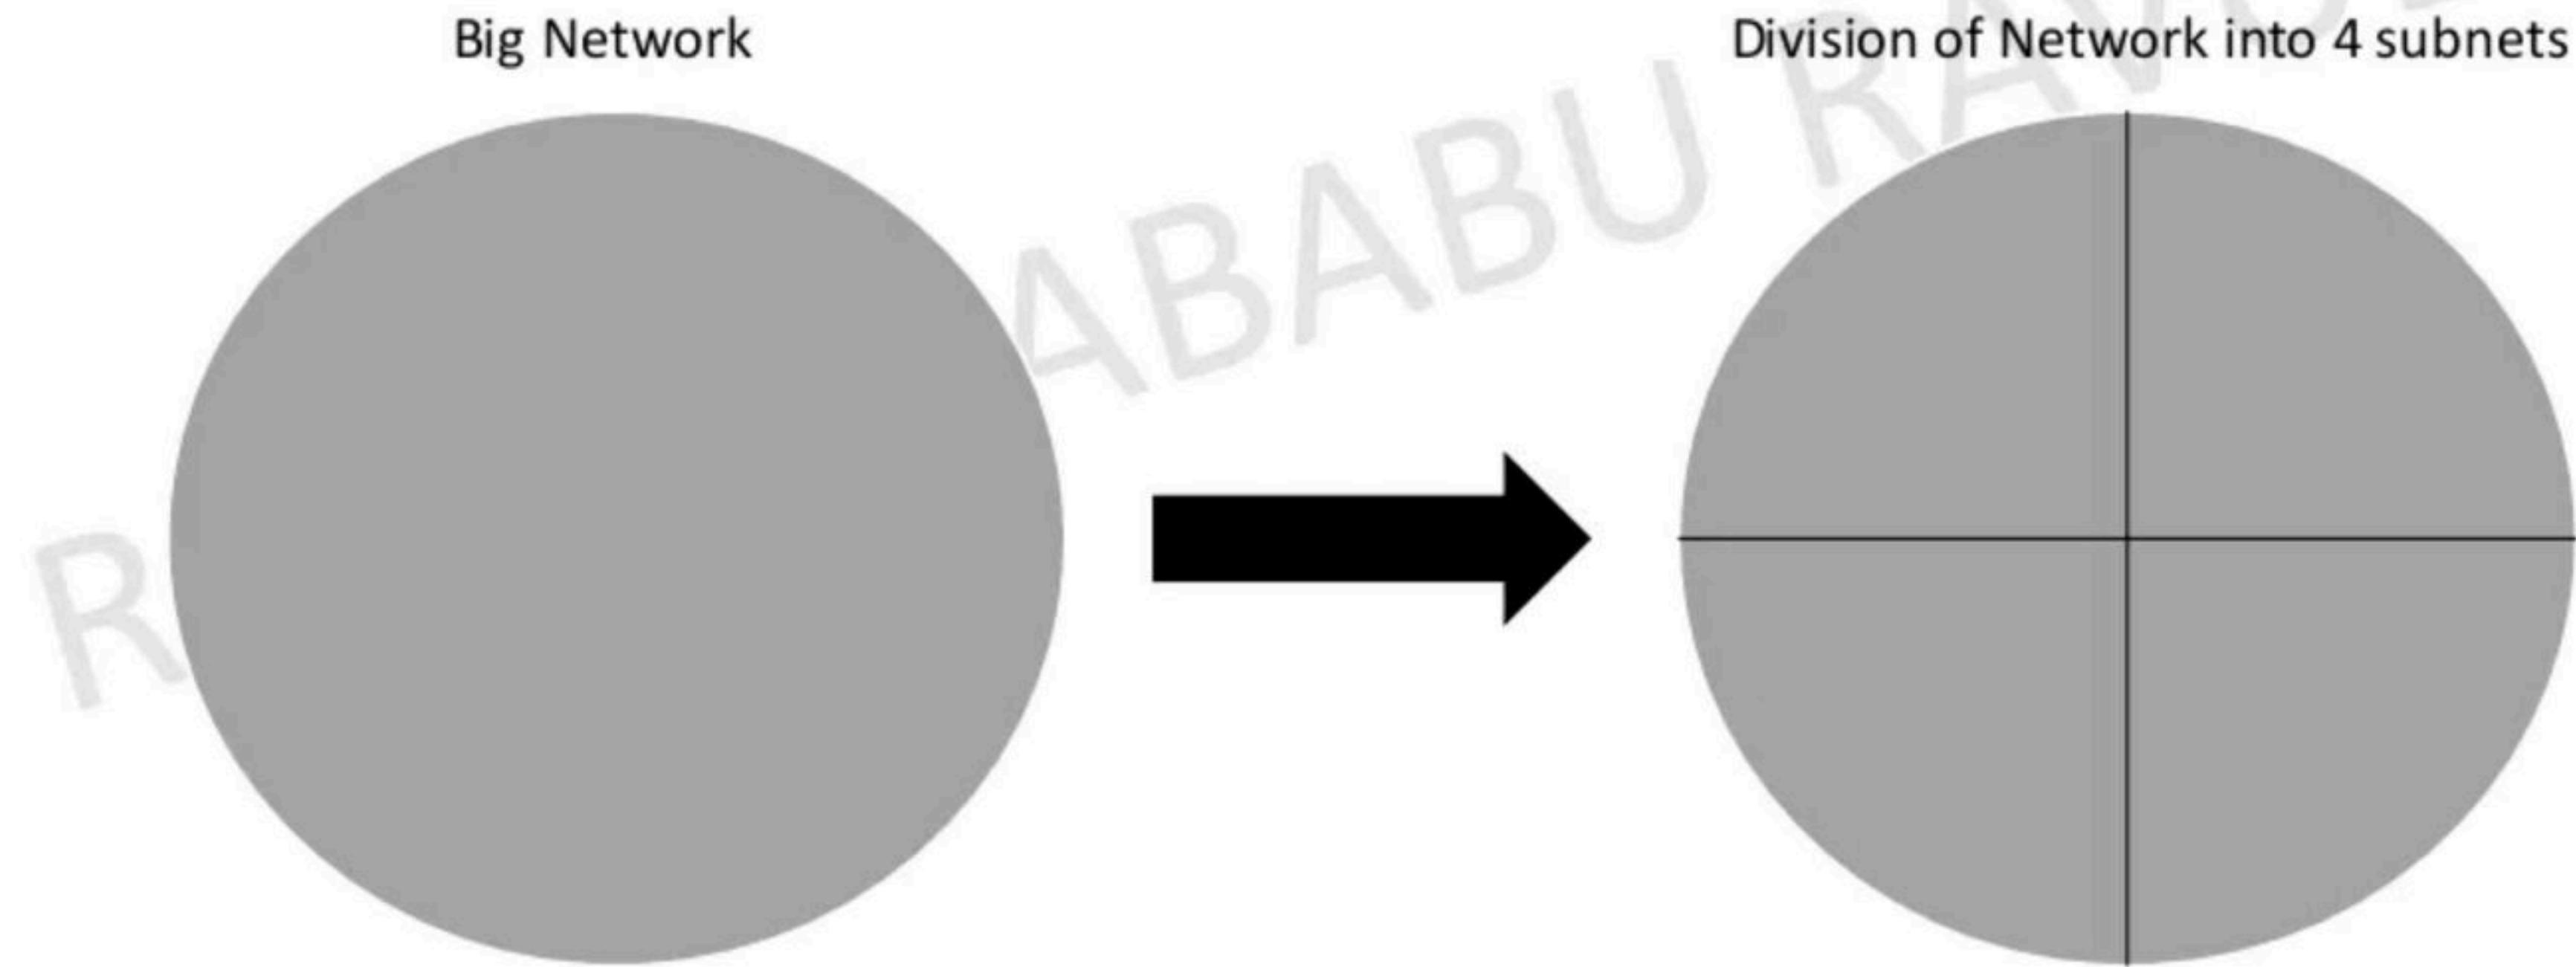

RAVINDRABABU RAVULA

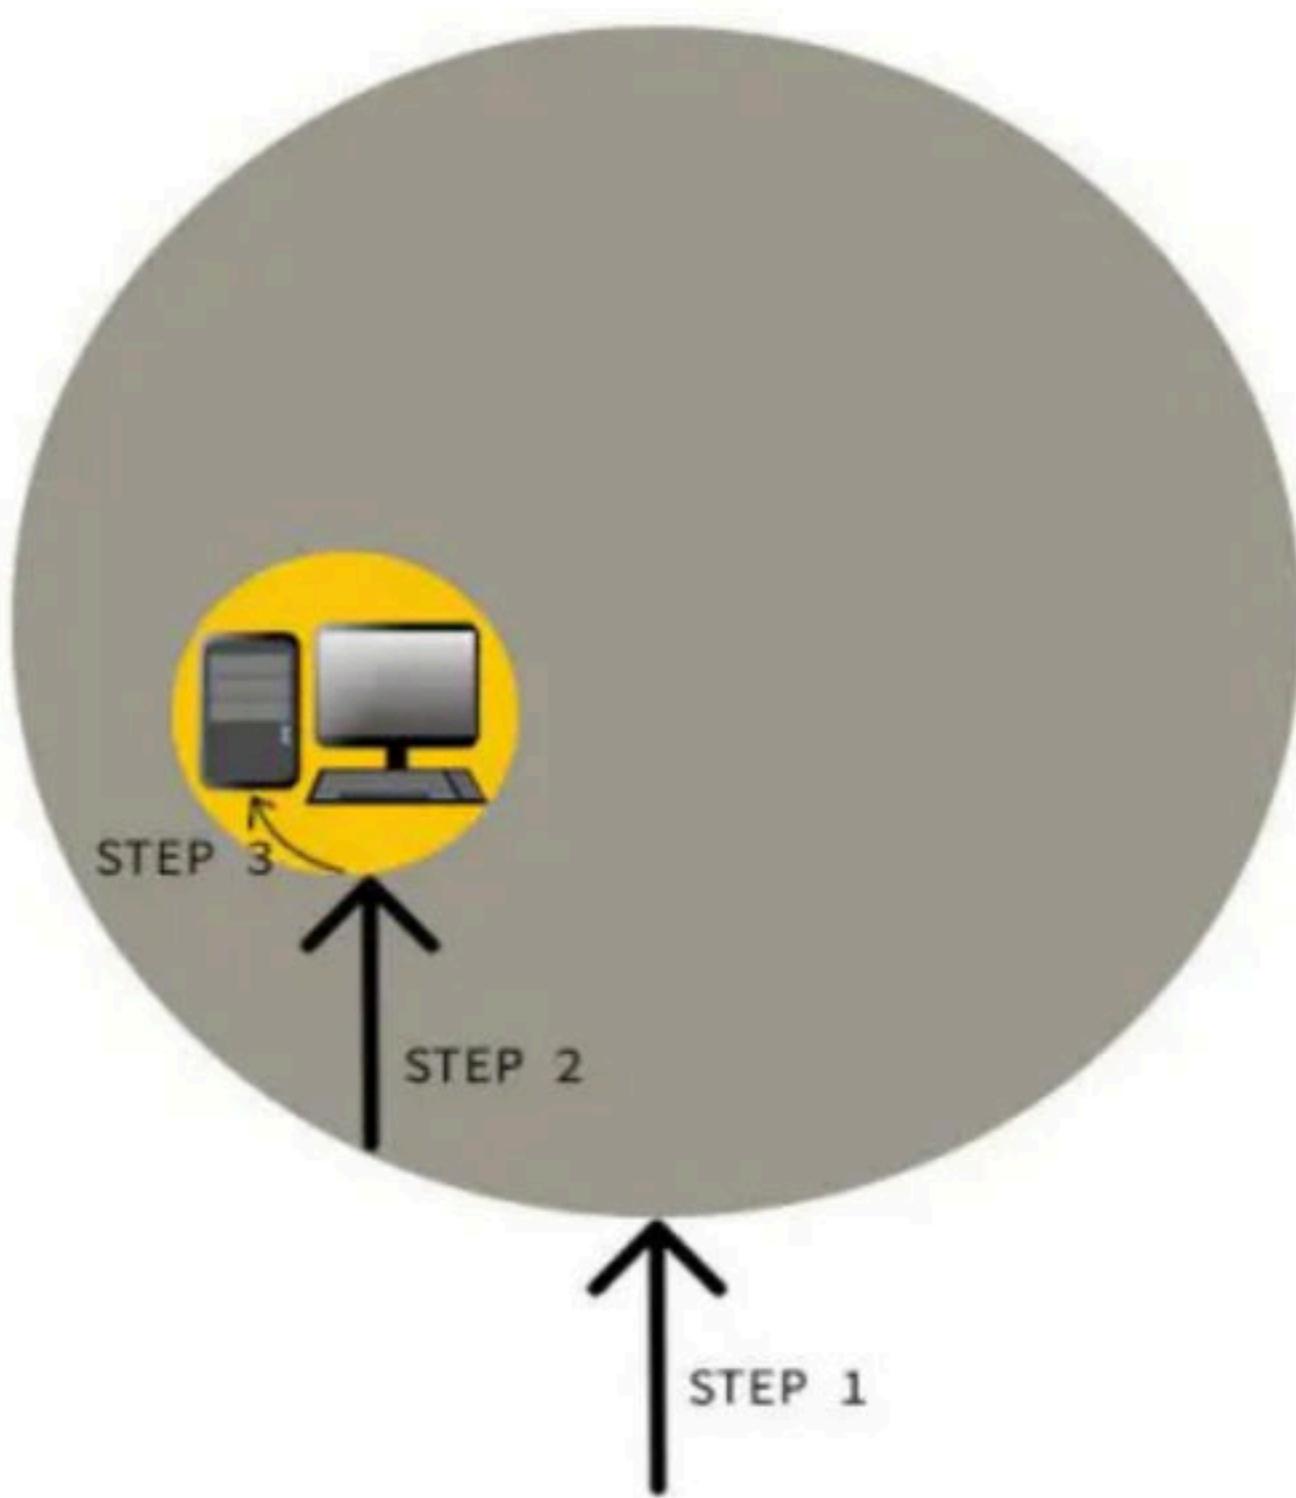

RAVINDRABABU RAVULA

Subnetting

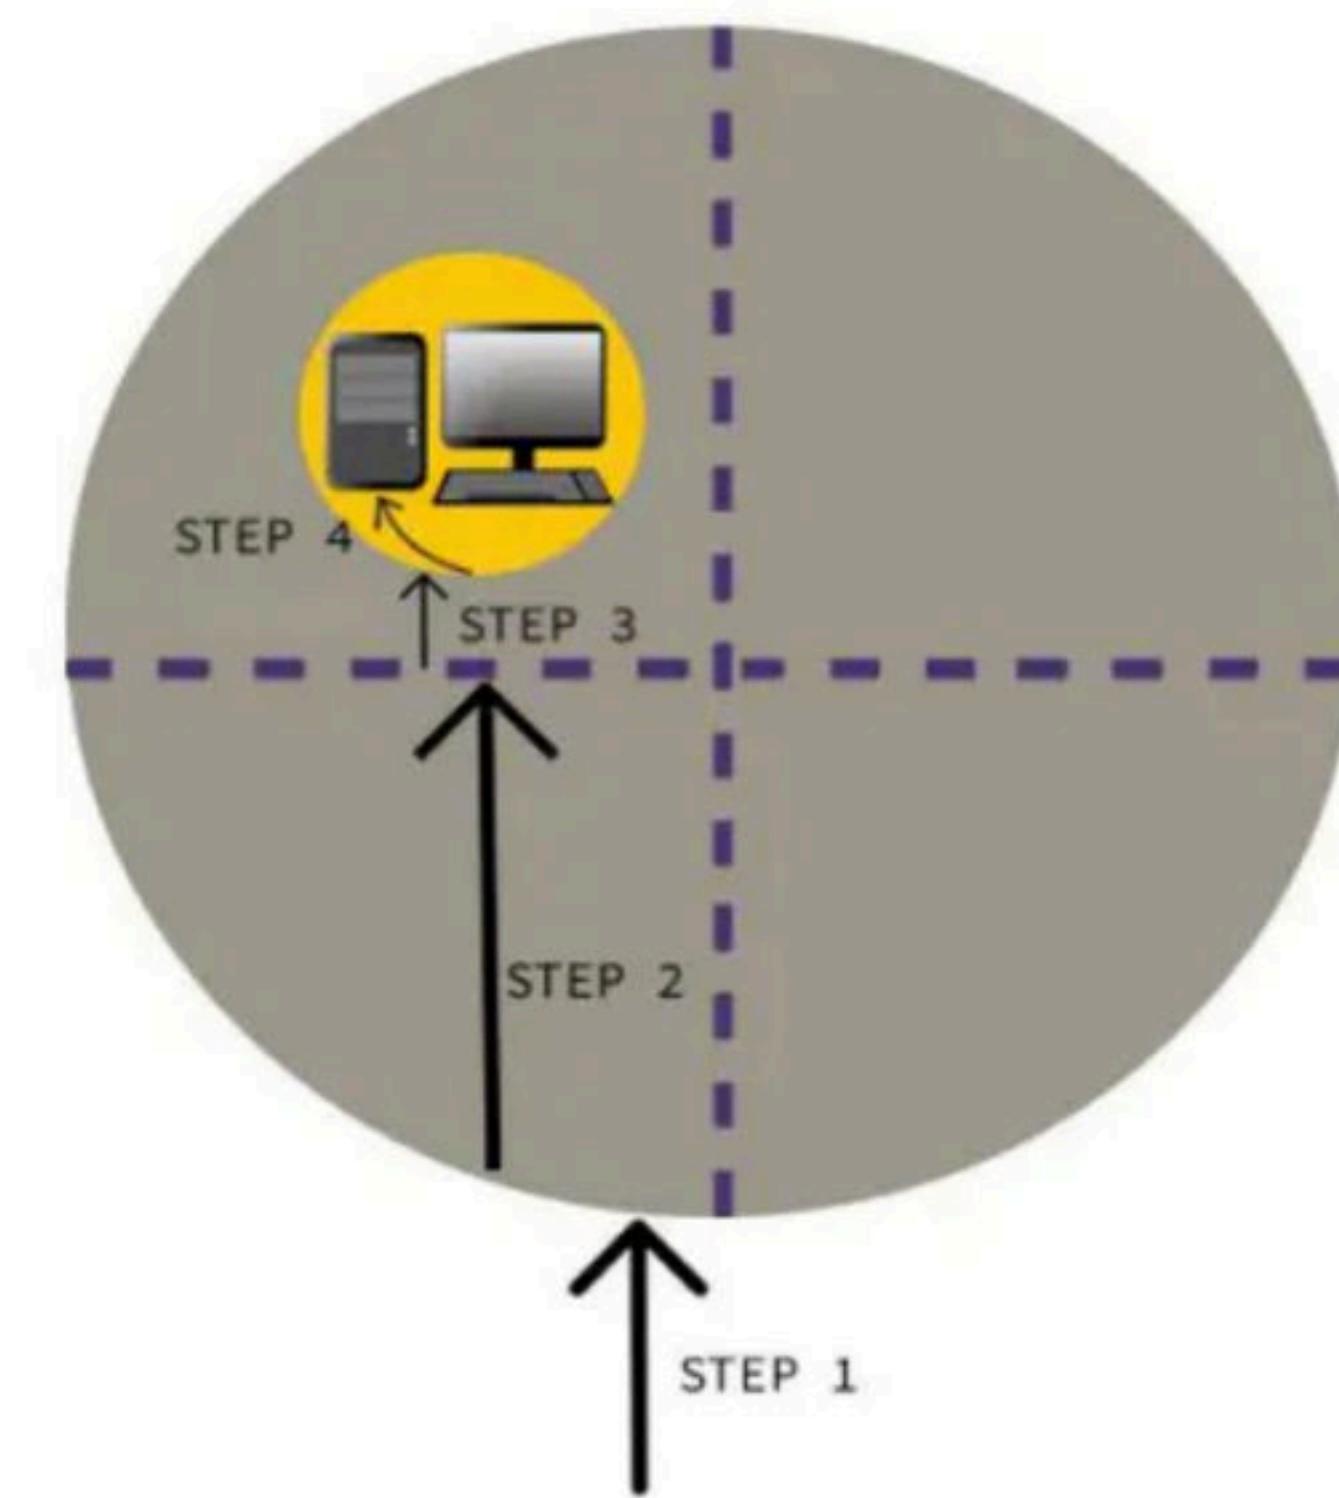

The process of dividing a single network into multiple sub networks is called as subnetting.
The sub networks so created are called as subnets.

REACHING A HOST WITHOUT SUBNETTING

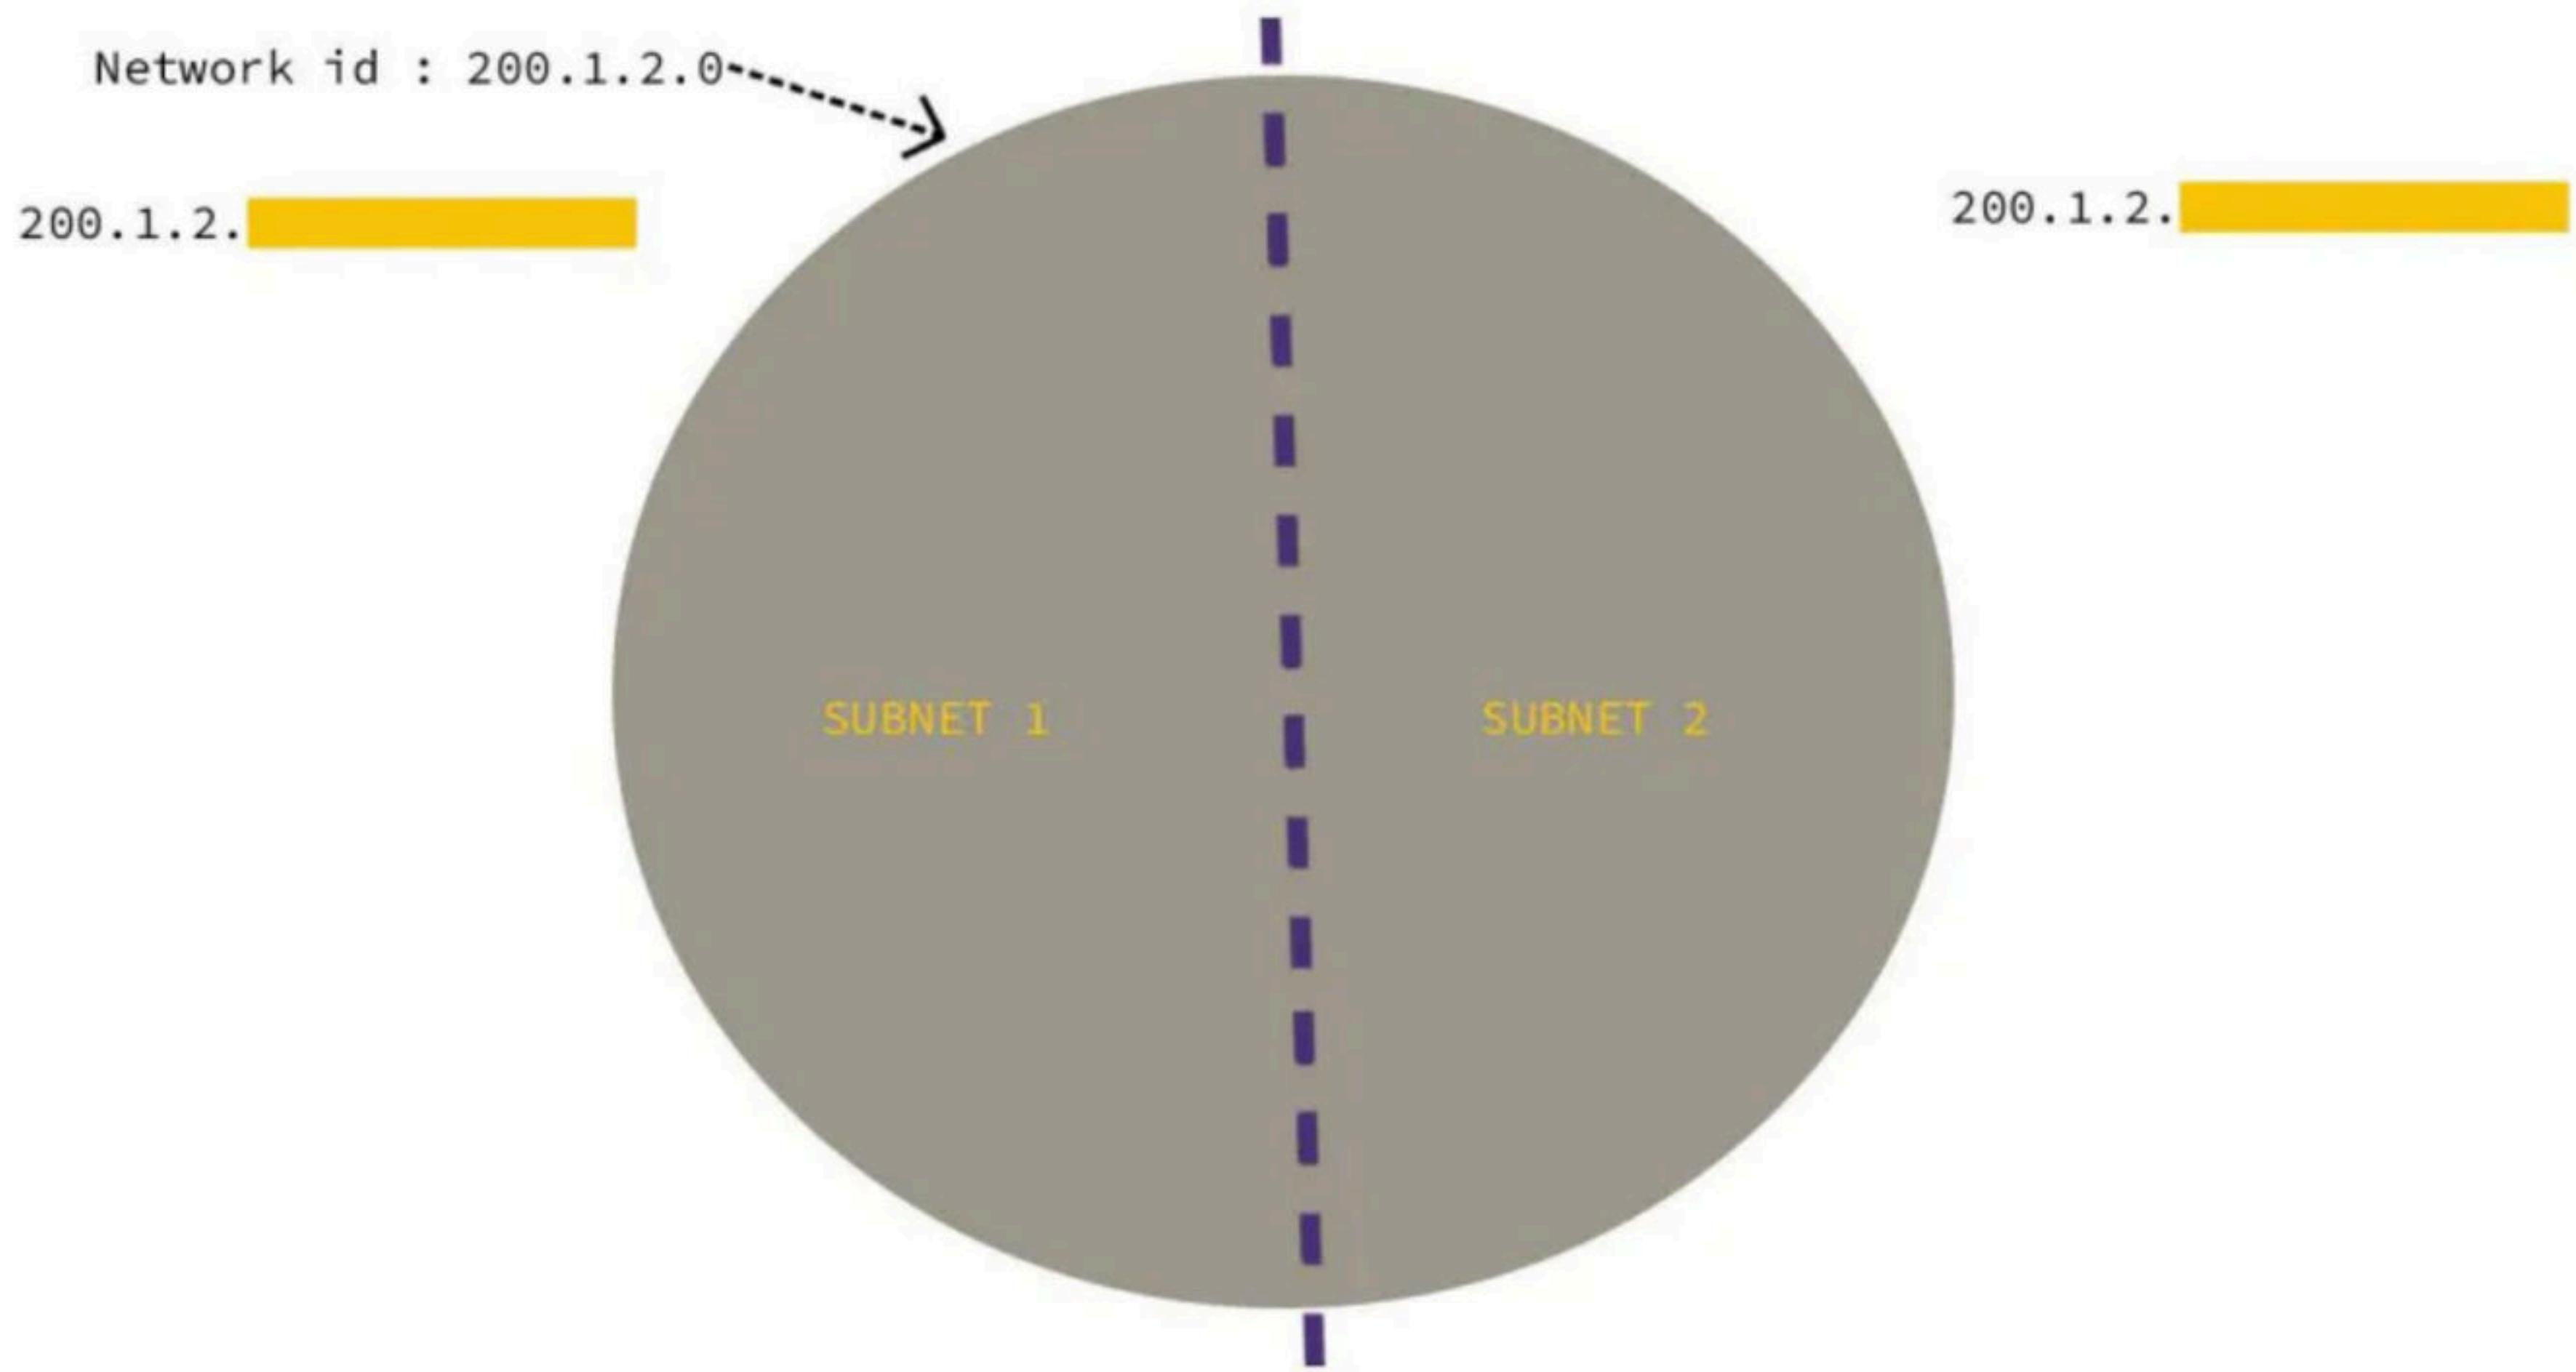

REACHING A HOST WITH SUBNETTING

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

Dividing the Network into 2 subnets

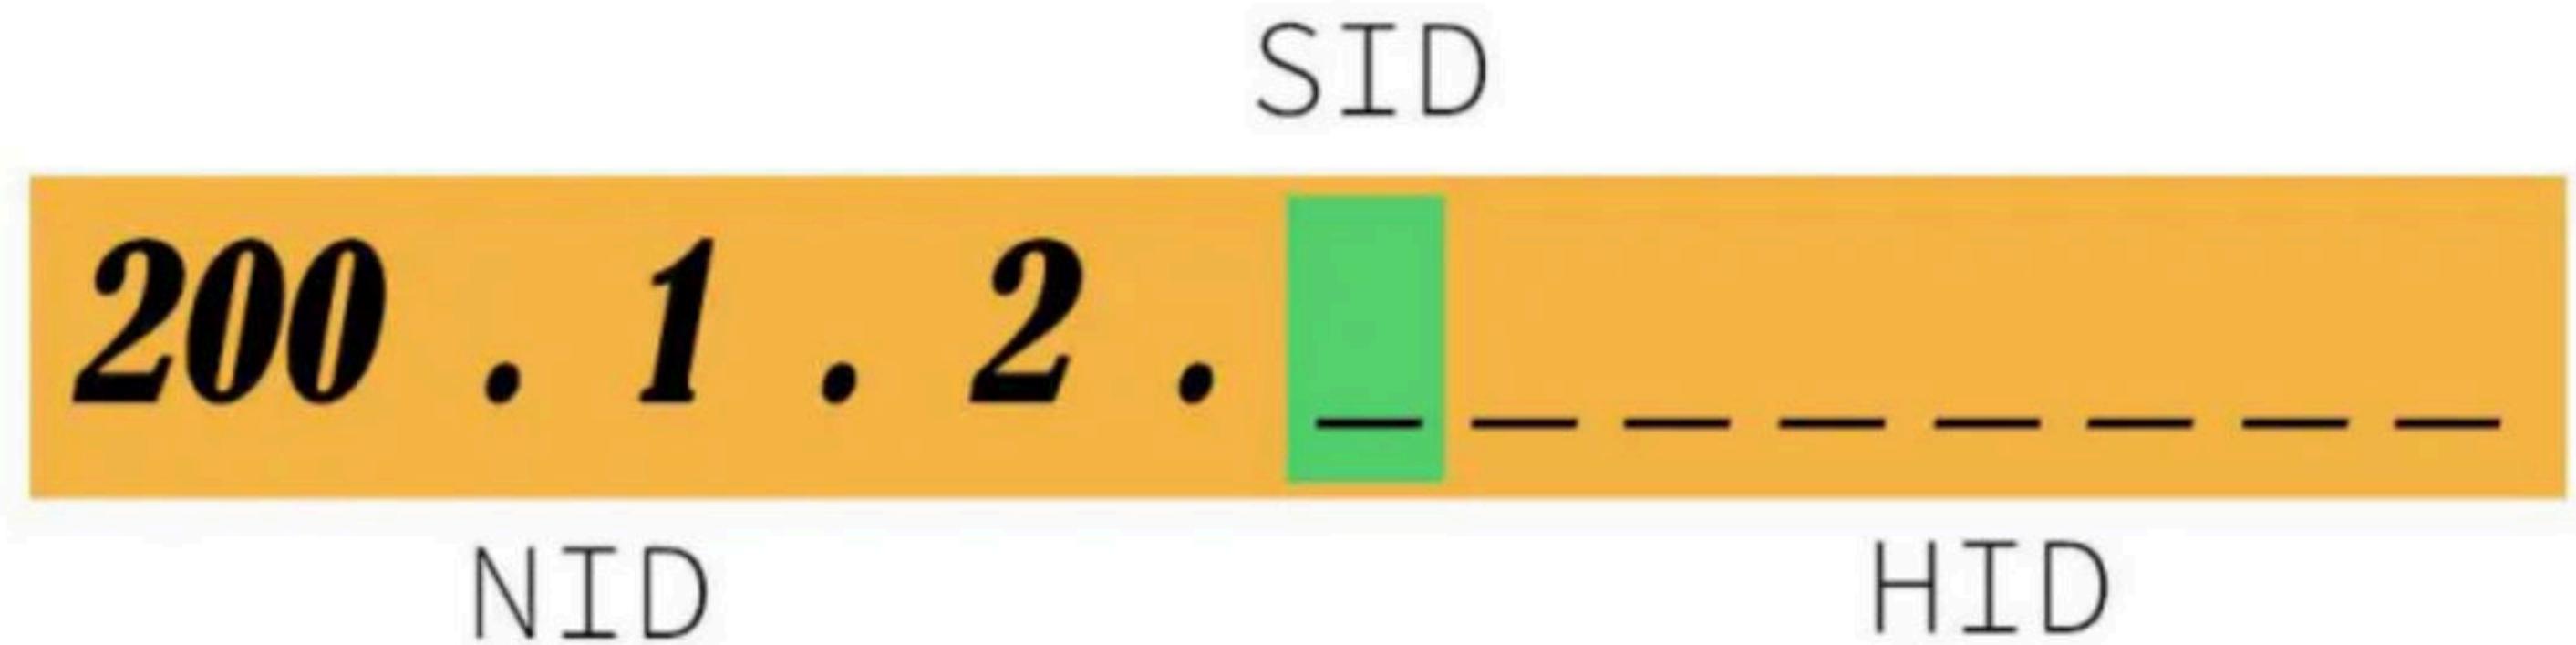

For creating two subnets and to represent their subnet IDs, we require 1 bit.

So,

We borrow one bit from the Host ID part.

After borrowing one bit, Host ID part remains with only 7 bits.

Network id : 200.1.2.0

200.1.2.0ooooooooo

200.1.2.0ooooooo01

200.1.2.0oooooo10

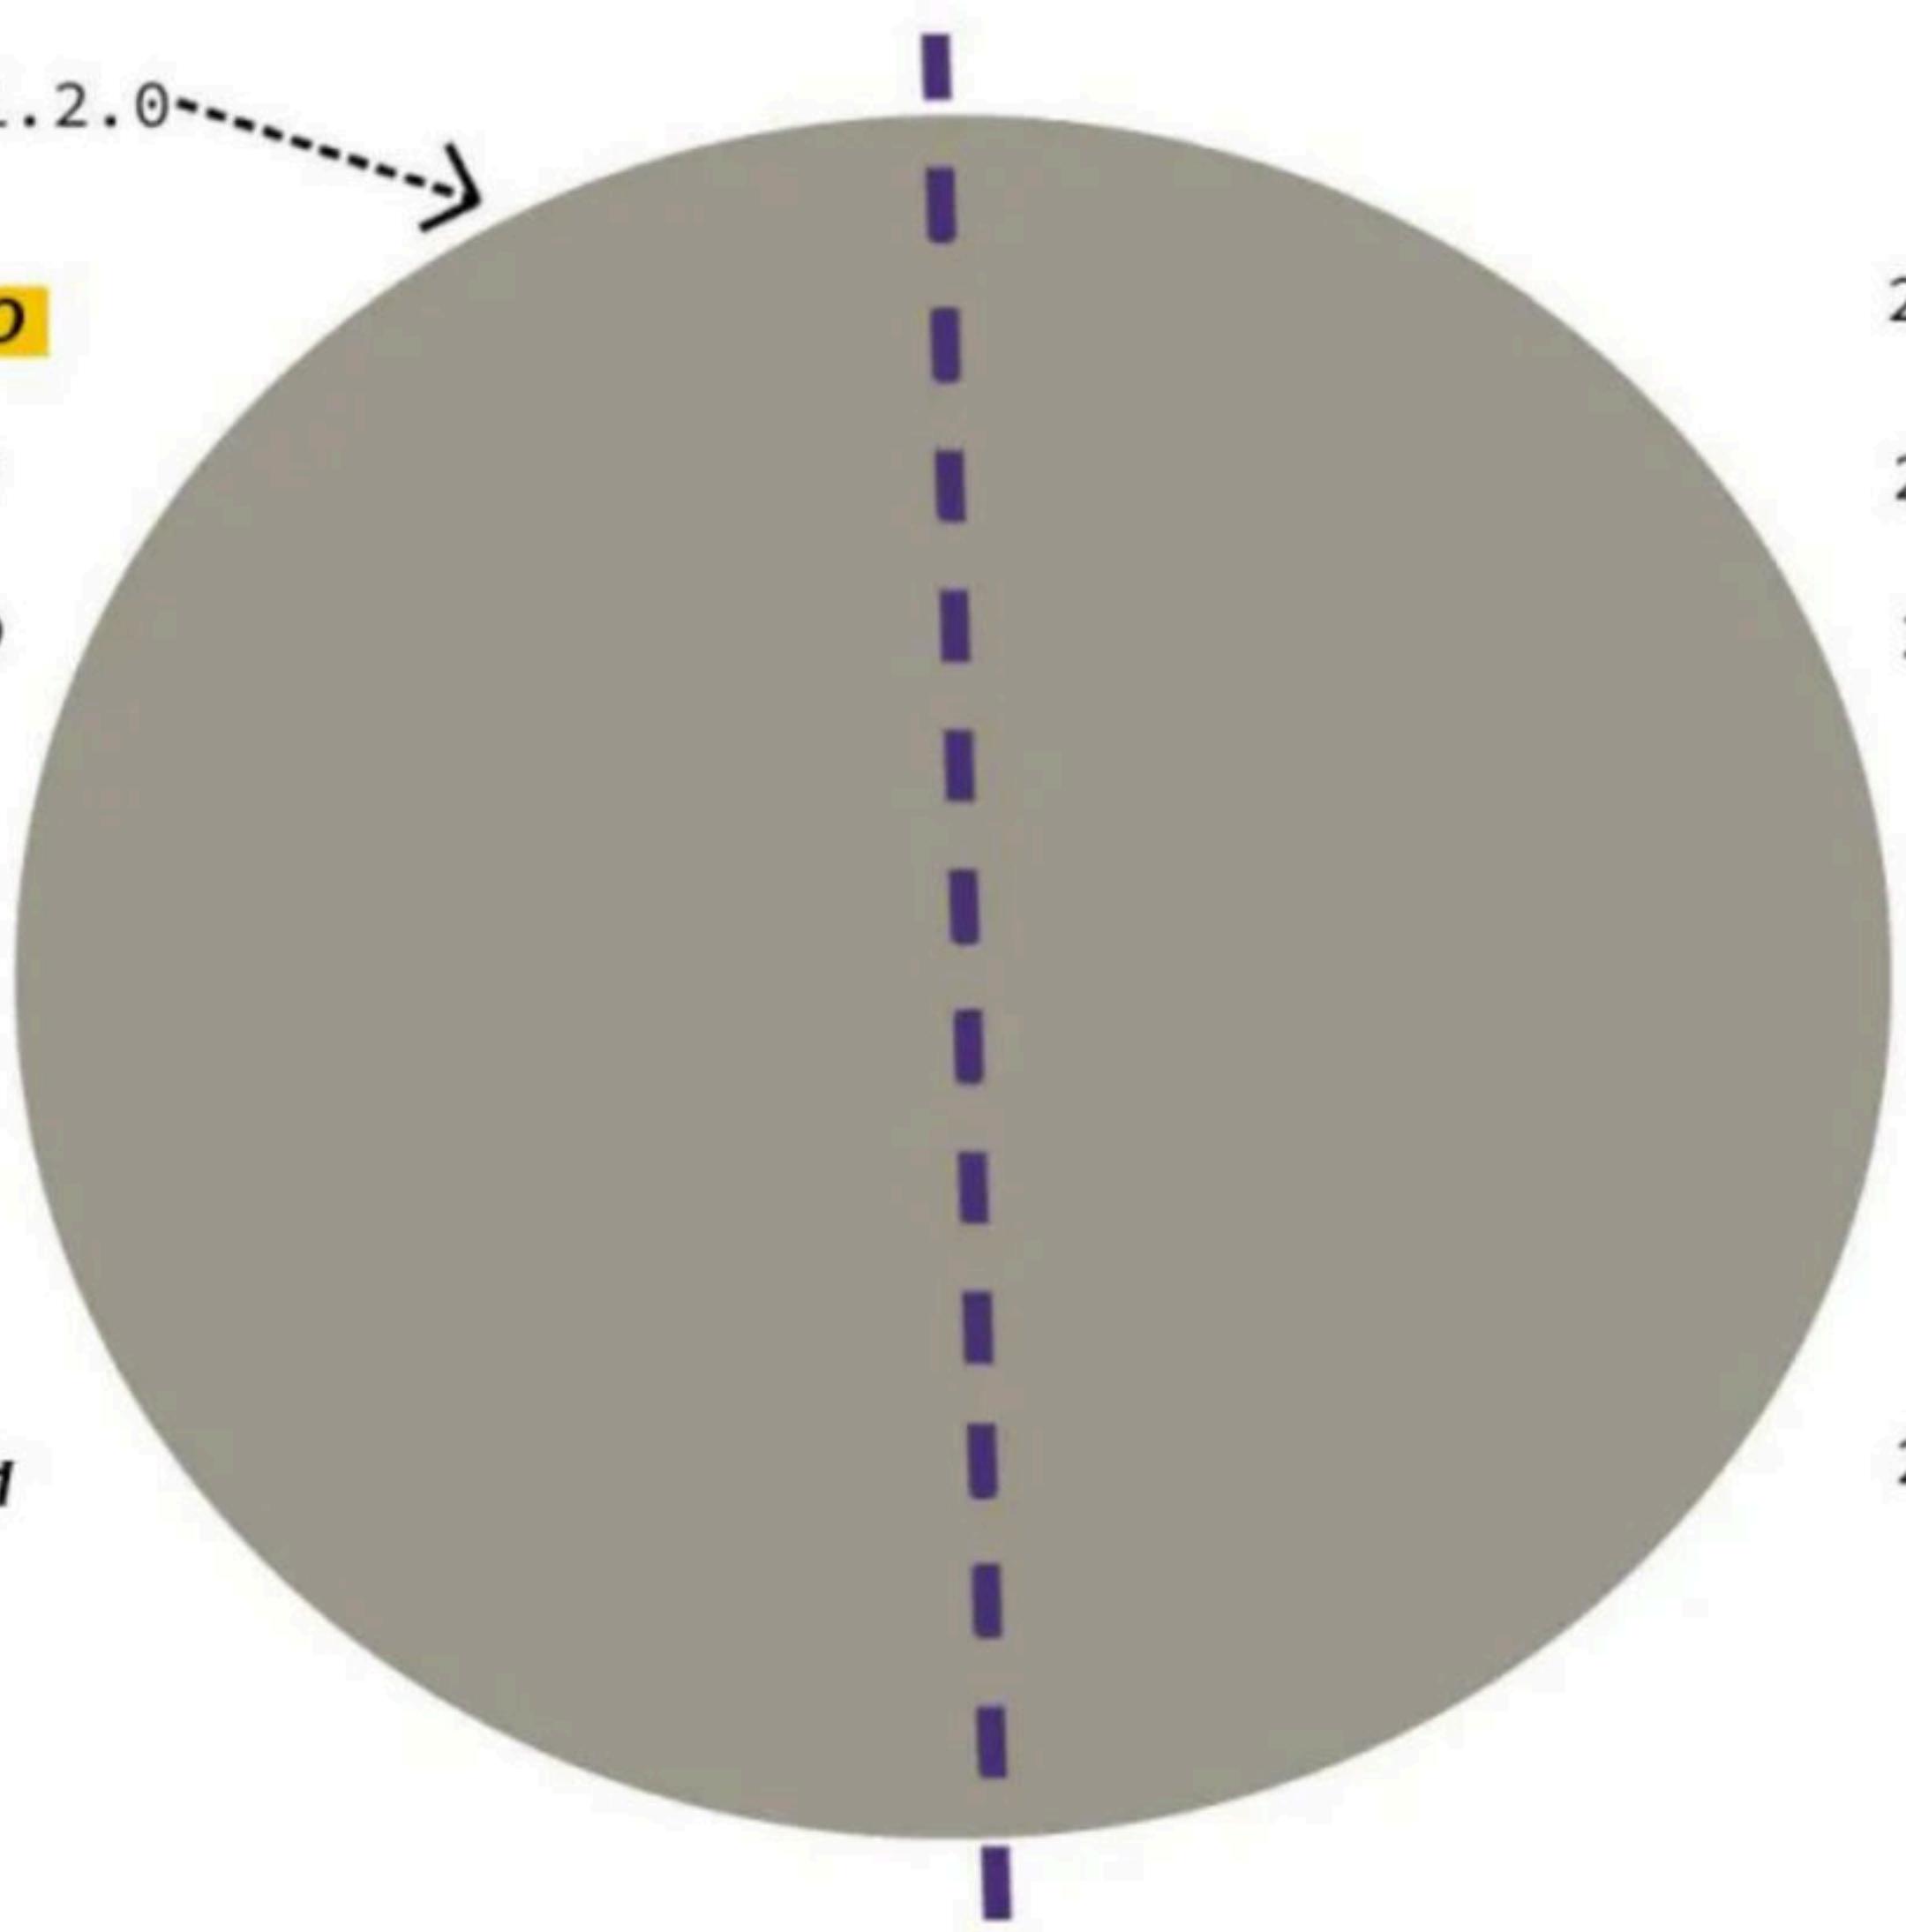

200.1.2.01111111

SCENARIO 1

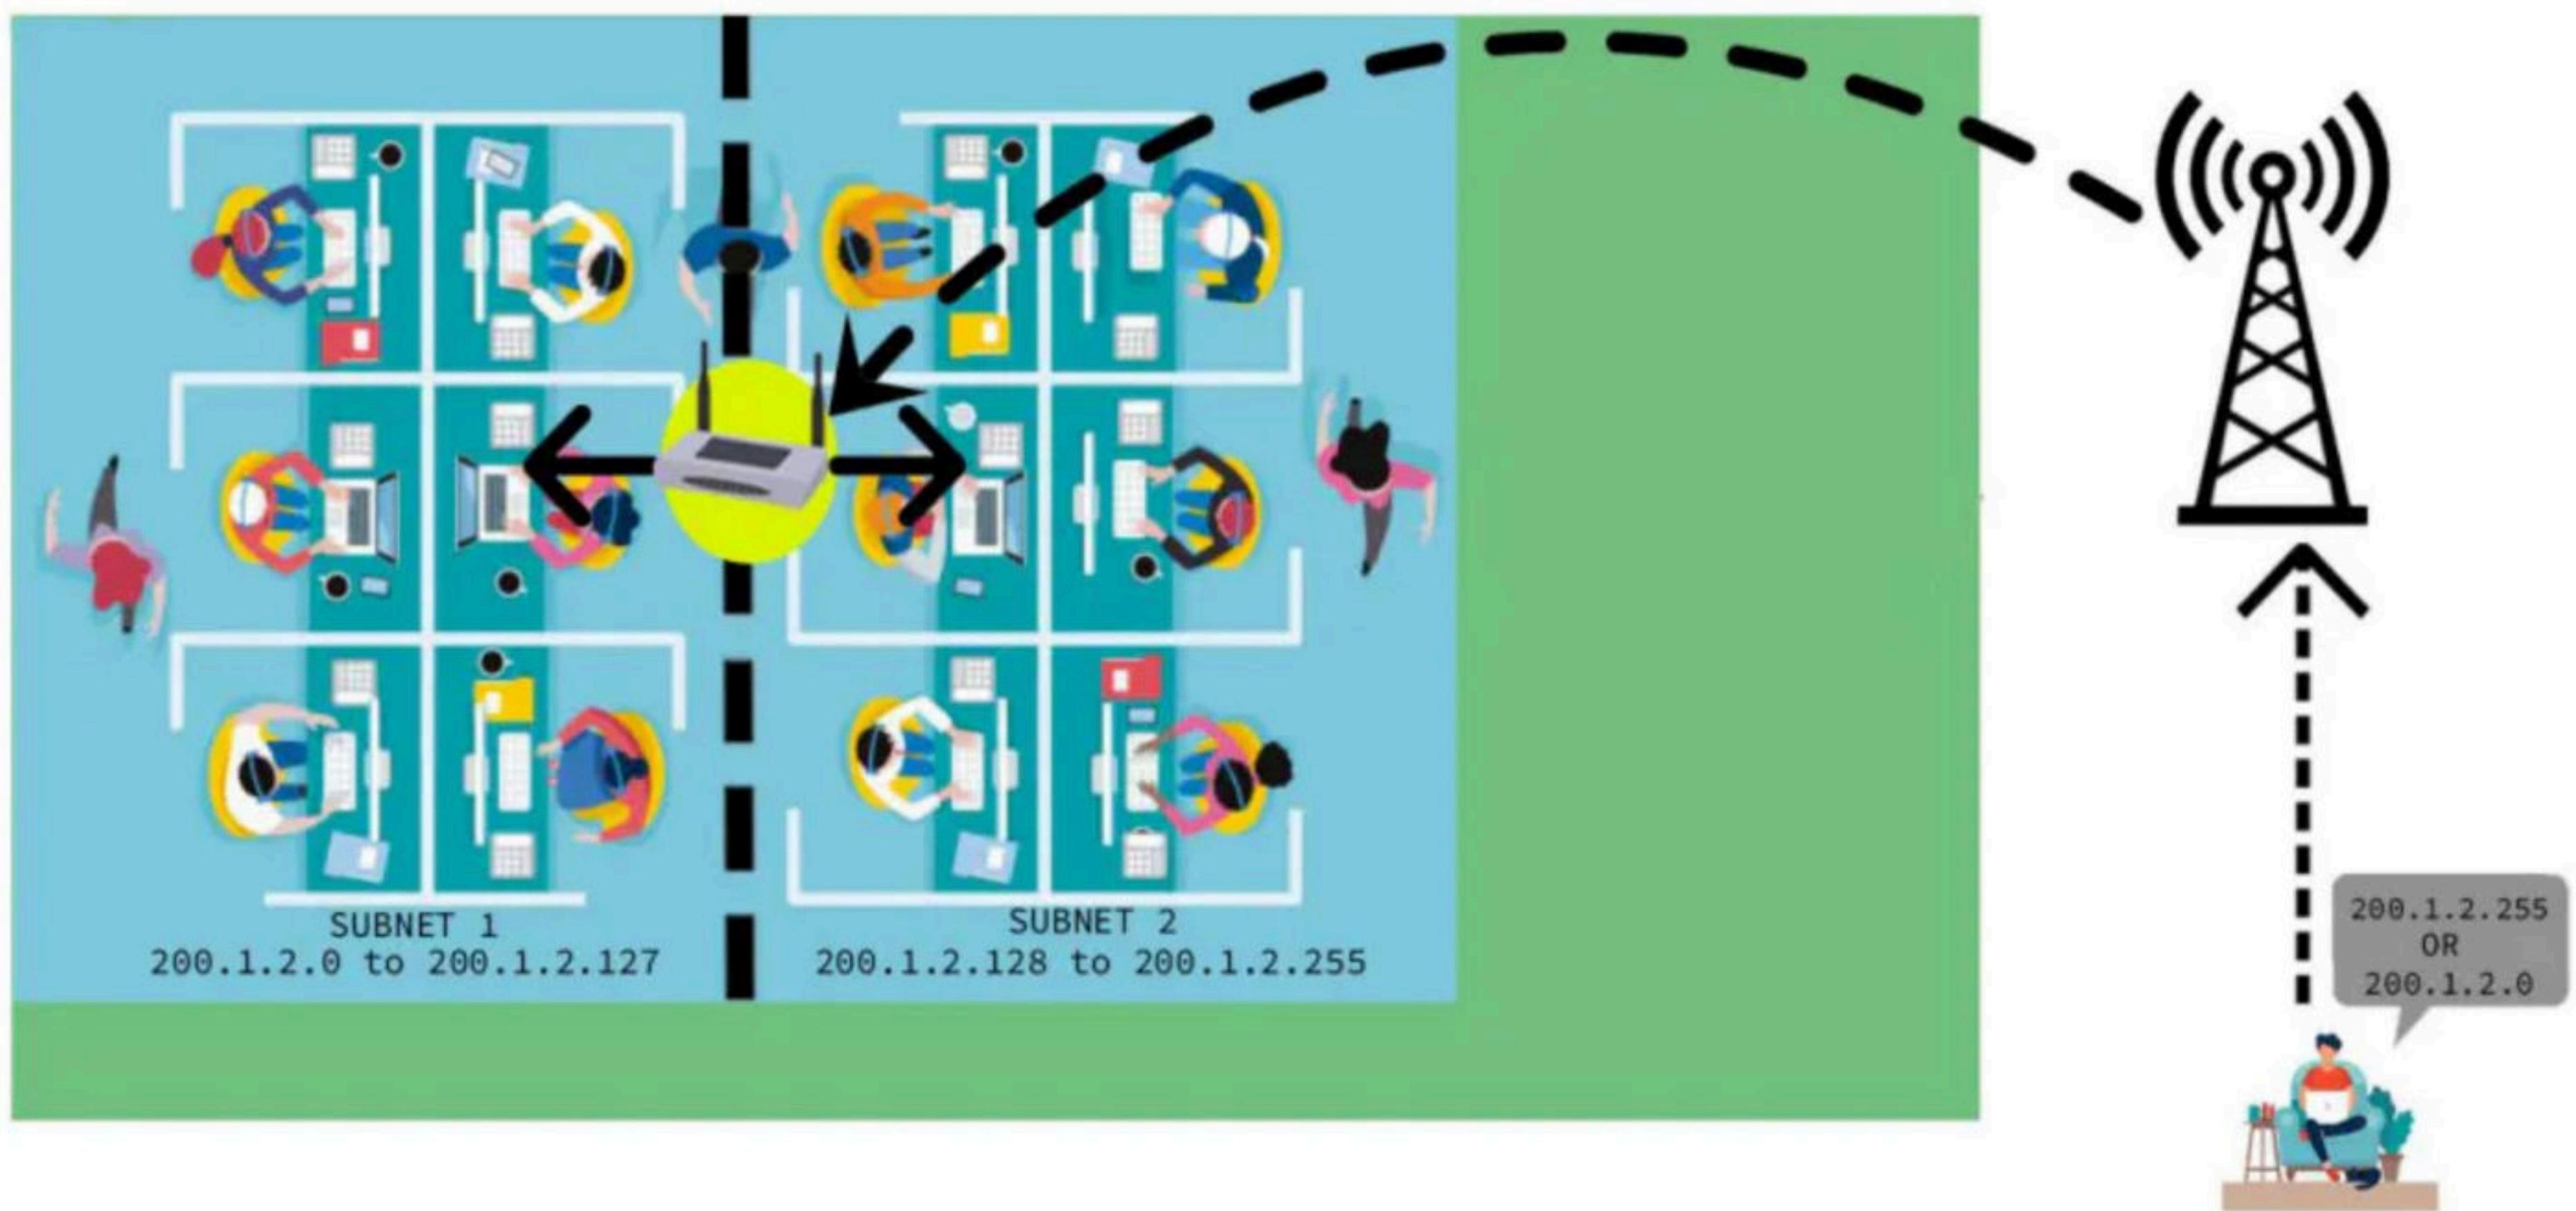

A

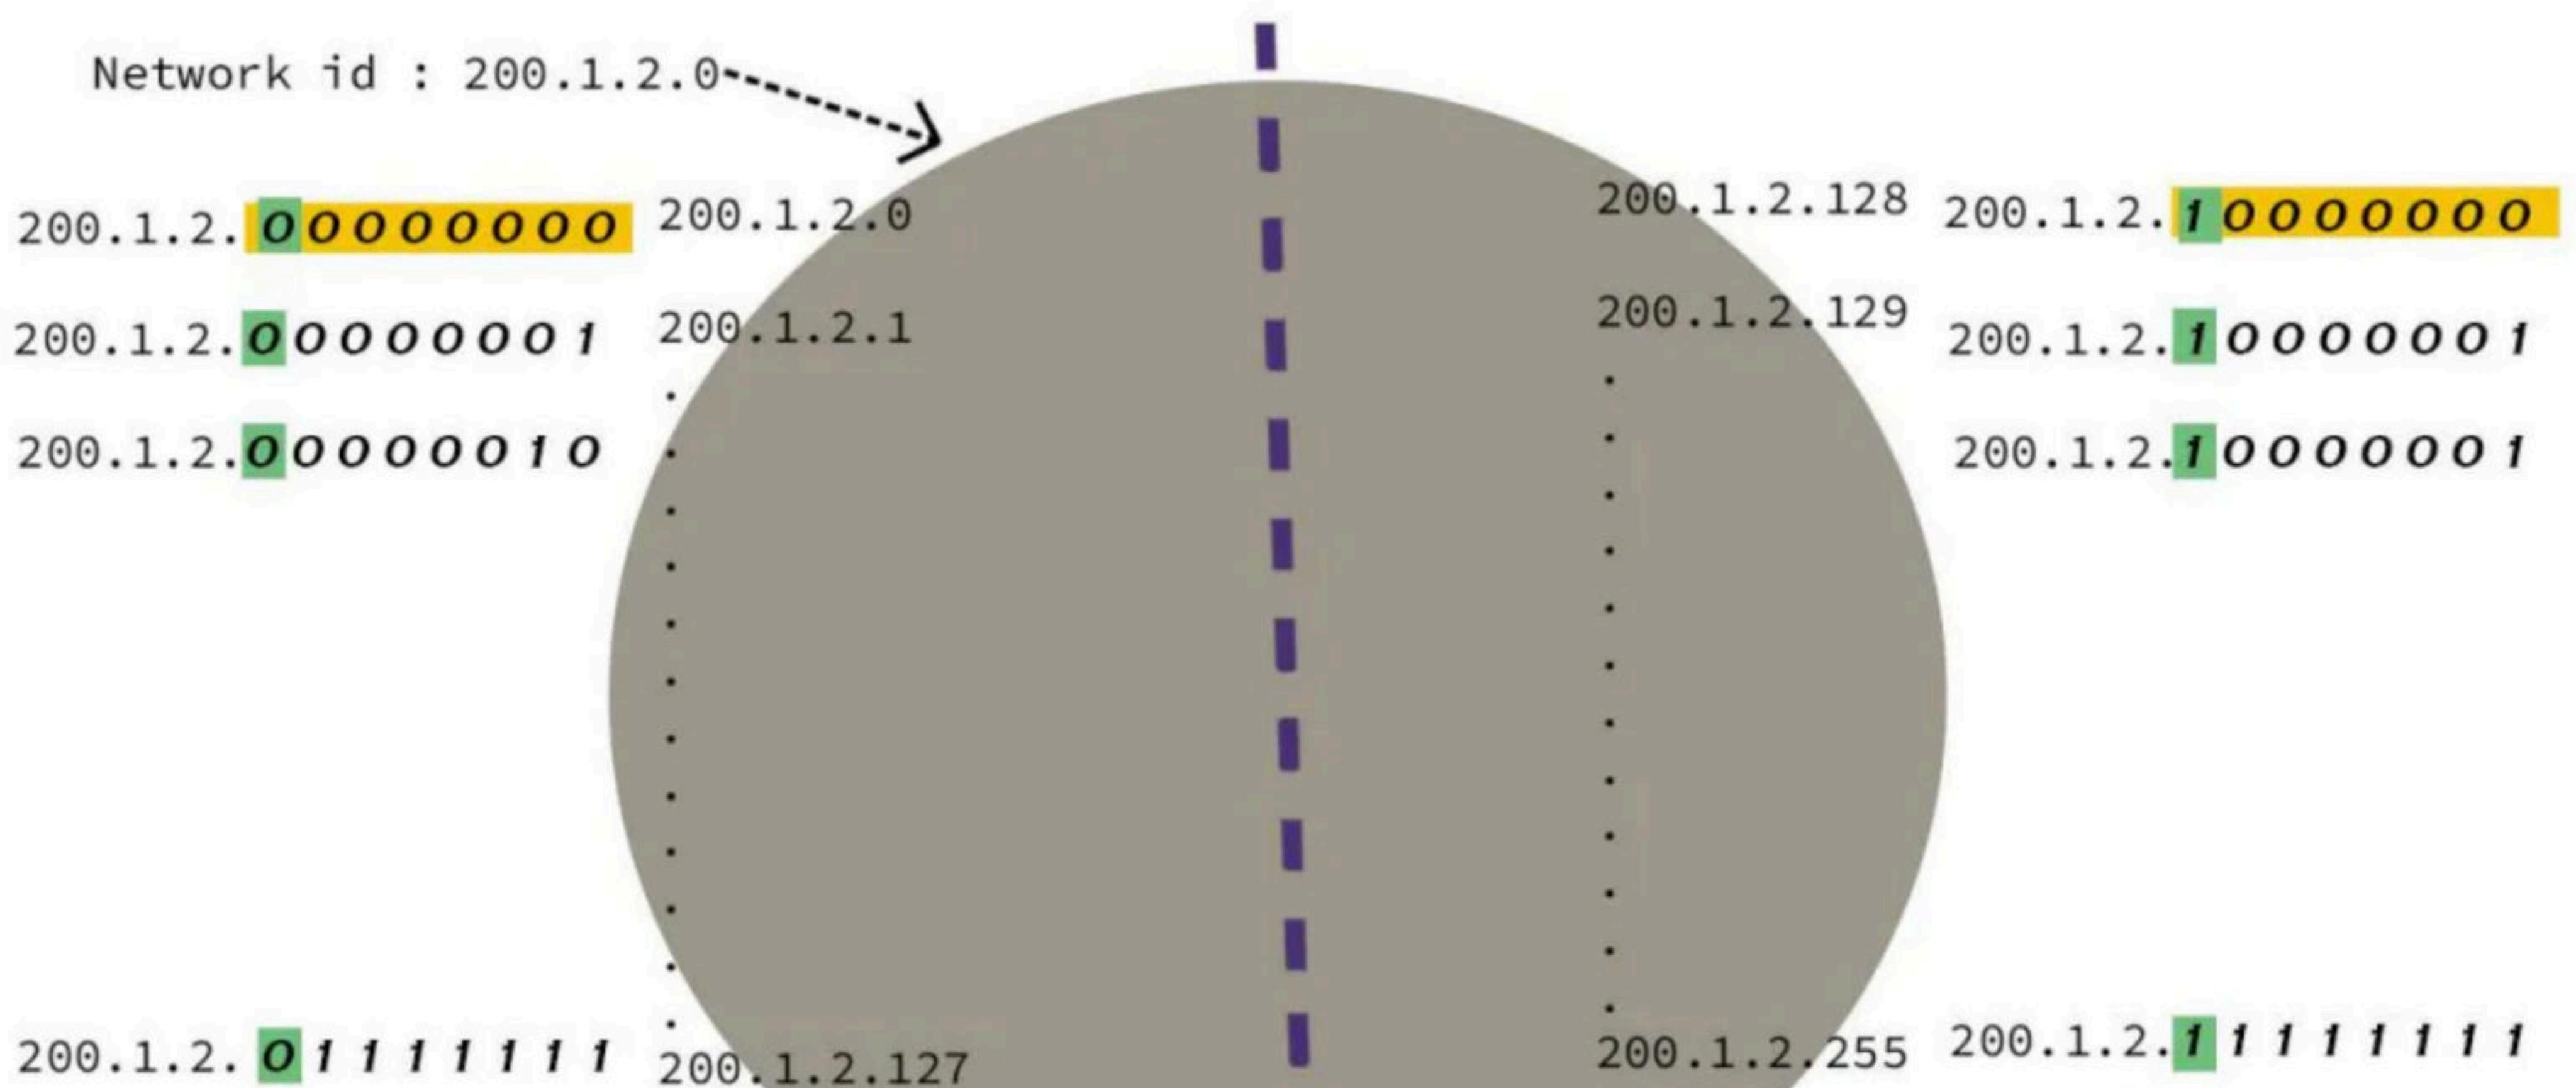

F

SCENARIO 2

SCENARIO 3

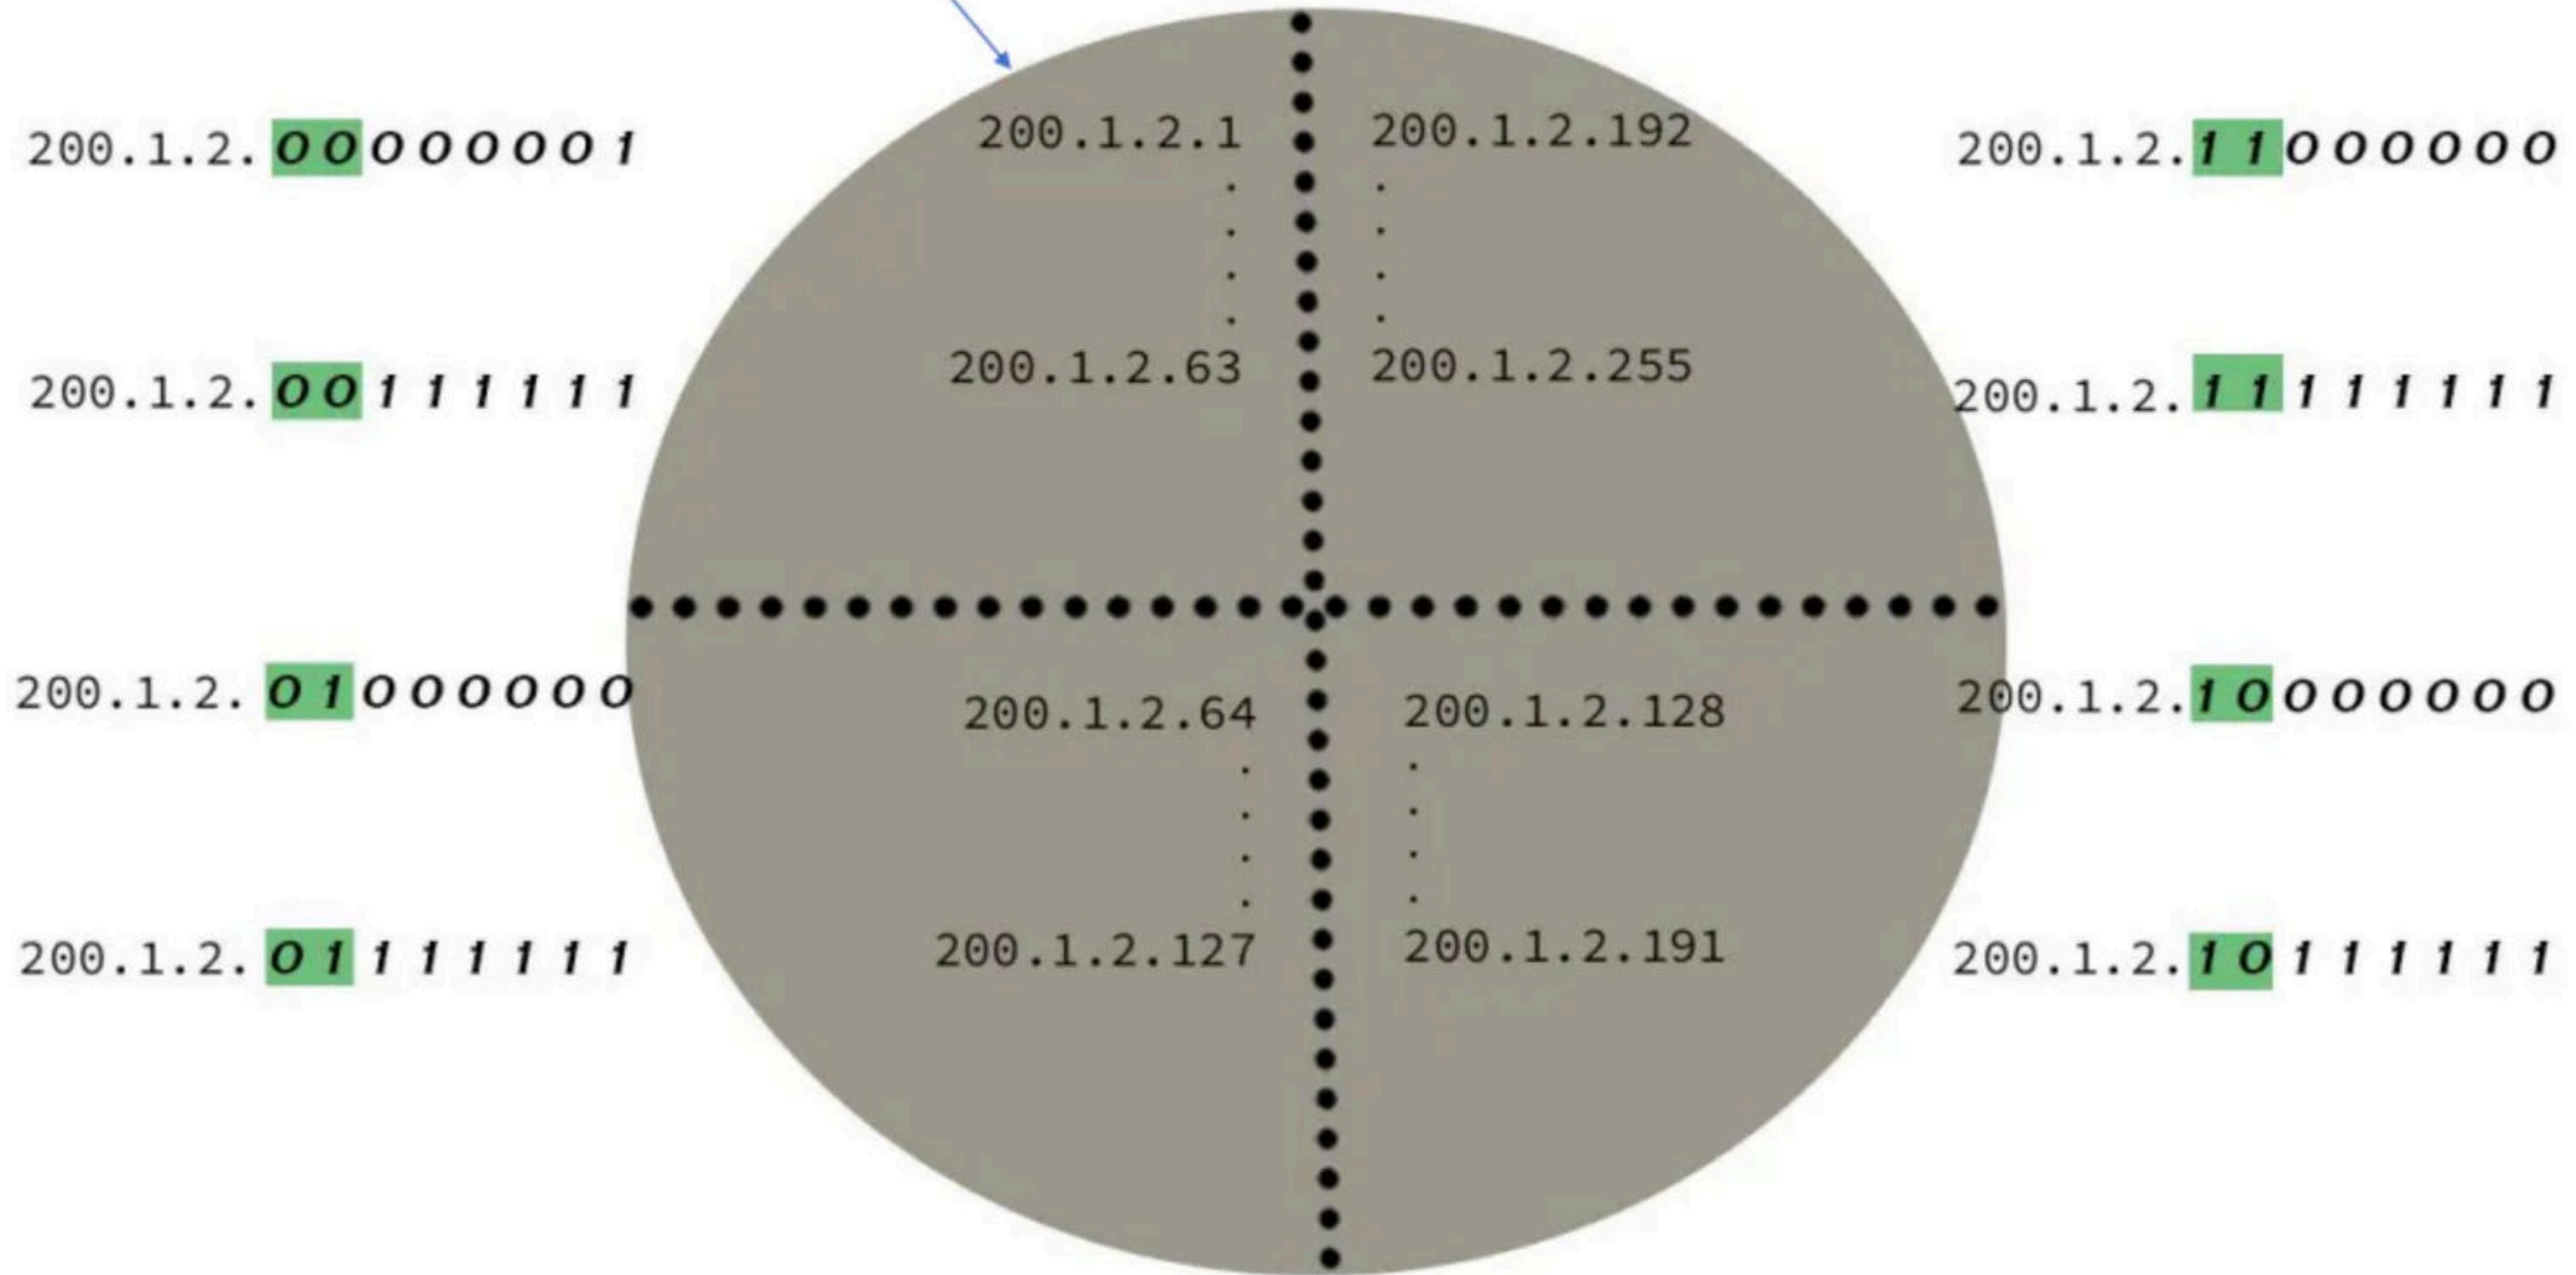

- IP Address of the subnet = 200.1.2.0
- Total number of IP Addresses = $2^7 = 128$
- Total number of hosts that can be configured = $128 - 2 = 126$
- Range of IP Addresses = [200.1.2.00000000, 200.1.2.01111111] = [200.1.2.0, 200.1.2.127]
- Direct Broadcast Address = 200.1.2.01111111 = 200.1.2.127
- Limited Broadcast Address = 255.255.255.255

- IP Address of the subnet = 200.1.2.128
- Total number of IP Addresses = $2^7 = 128$
- Total number of hosts that can be configured = $128 - 2 = 126$
- Range of IP Addresses = [200.1.2.10000000, 200.1.2.11111111] = [200.1.2.128, 200.1.2.255]
- Direct Broadcast Address = 200.1.2.11111111 = 200.1.2.255
- Limited Broadcast Address = 255.255.255.255

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

DIVIDING INTO 4 SUBNETS: NID : 200.1.2.0

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

IP Address of the four subnets are-

- 200.1.2.**00000000** = 200.1.2.0
- 200.1.2.**01000000** = 200.1.2.64
- 200.1.2.**10000000** = 200.1.2.128
- 200.1.2.**11000000** = 200.1.2.192

For 1st Subnet-

- IP Address of the subnet = 200.1.2.0
- Total number of IP Addresses = $2^6 = 64$
- Total number of hosts that can be configured = $64 - 2 = 62$
- Range of IP Addresses = [200.1.2.**00000000**, 200.1.2.**00111111**] = [200.1.2.0, 200.1.2.63]
- Direct Broadcast Address = 200.1.2.**00111111** = 200.1.2.63
- Limited Broadcast Address = 255.255.255.255

For 4th Subnet-

- IP Address of the subnet = 200.1.2.192
- Total number of IP Addresses = $2^6 = 64$
- Total number of hosts that can be configured = $64 - 2 = 62$
- Range of IP Addresses = [200.1.2.**11000000**, 200.1.2.**11111111**] = [200.1.2.192, 200.1.2.255]
- Direct Broadcast Address = 200.1.2.**11111111** = 200.1.2.255
- Limited Broadcast Address = 255.255.255.255

For 2nd Subnet-

- IP Address of the subnet = 200.1.2.64
- Total number of IP Addresses = $2^6 = 64$
- Total number of hosts that can be configured = $64 - 2 = 62$
- Range of IP Addresses = [200.1.2.**01000000**, 200.1.2.**01111111**] = [200.1.2.64, 200.1.2.127]
- Direct Broadcast Address = 200.1.2.**01111111** = 200.1.2.127
- Limited Broadcast Address = 255.255.255.255

For 3rd Subnet-

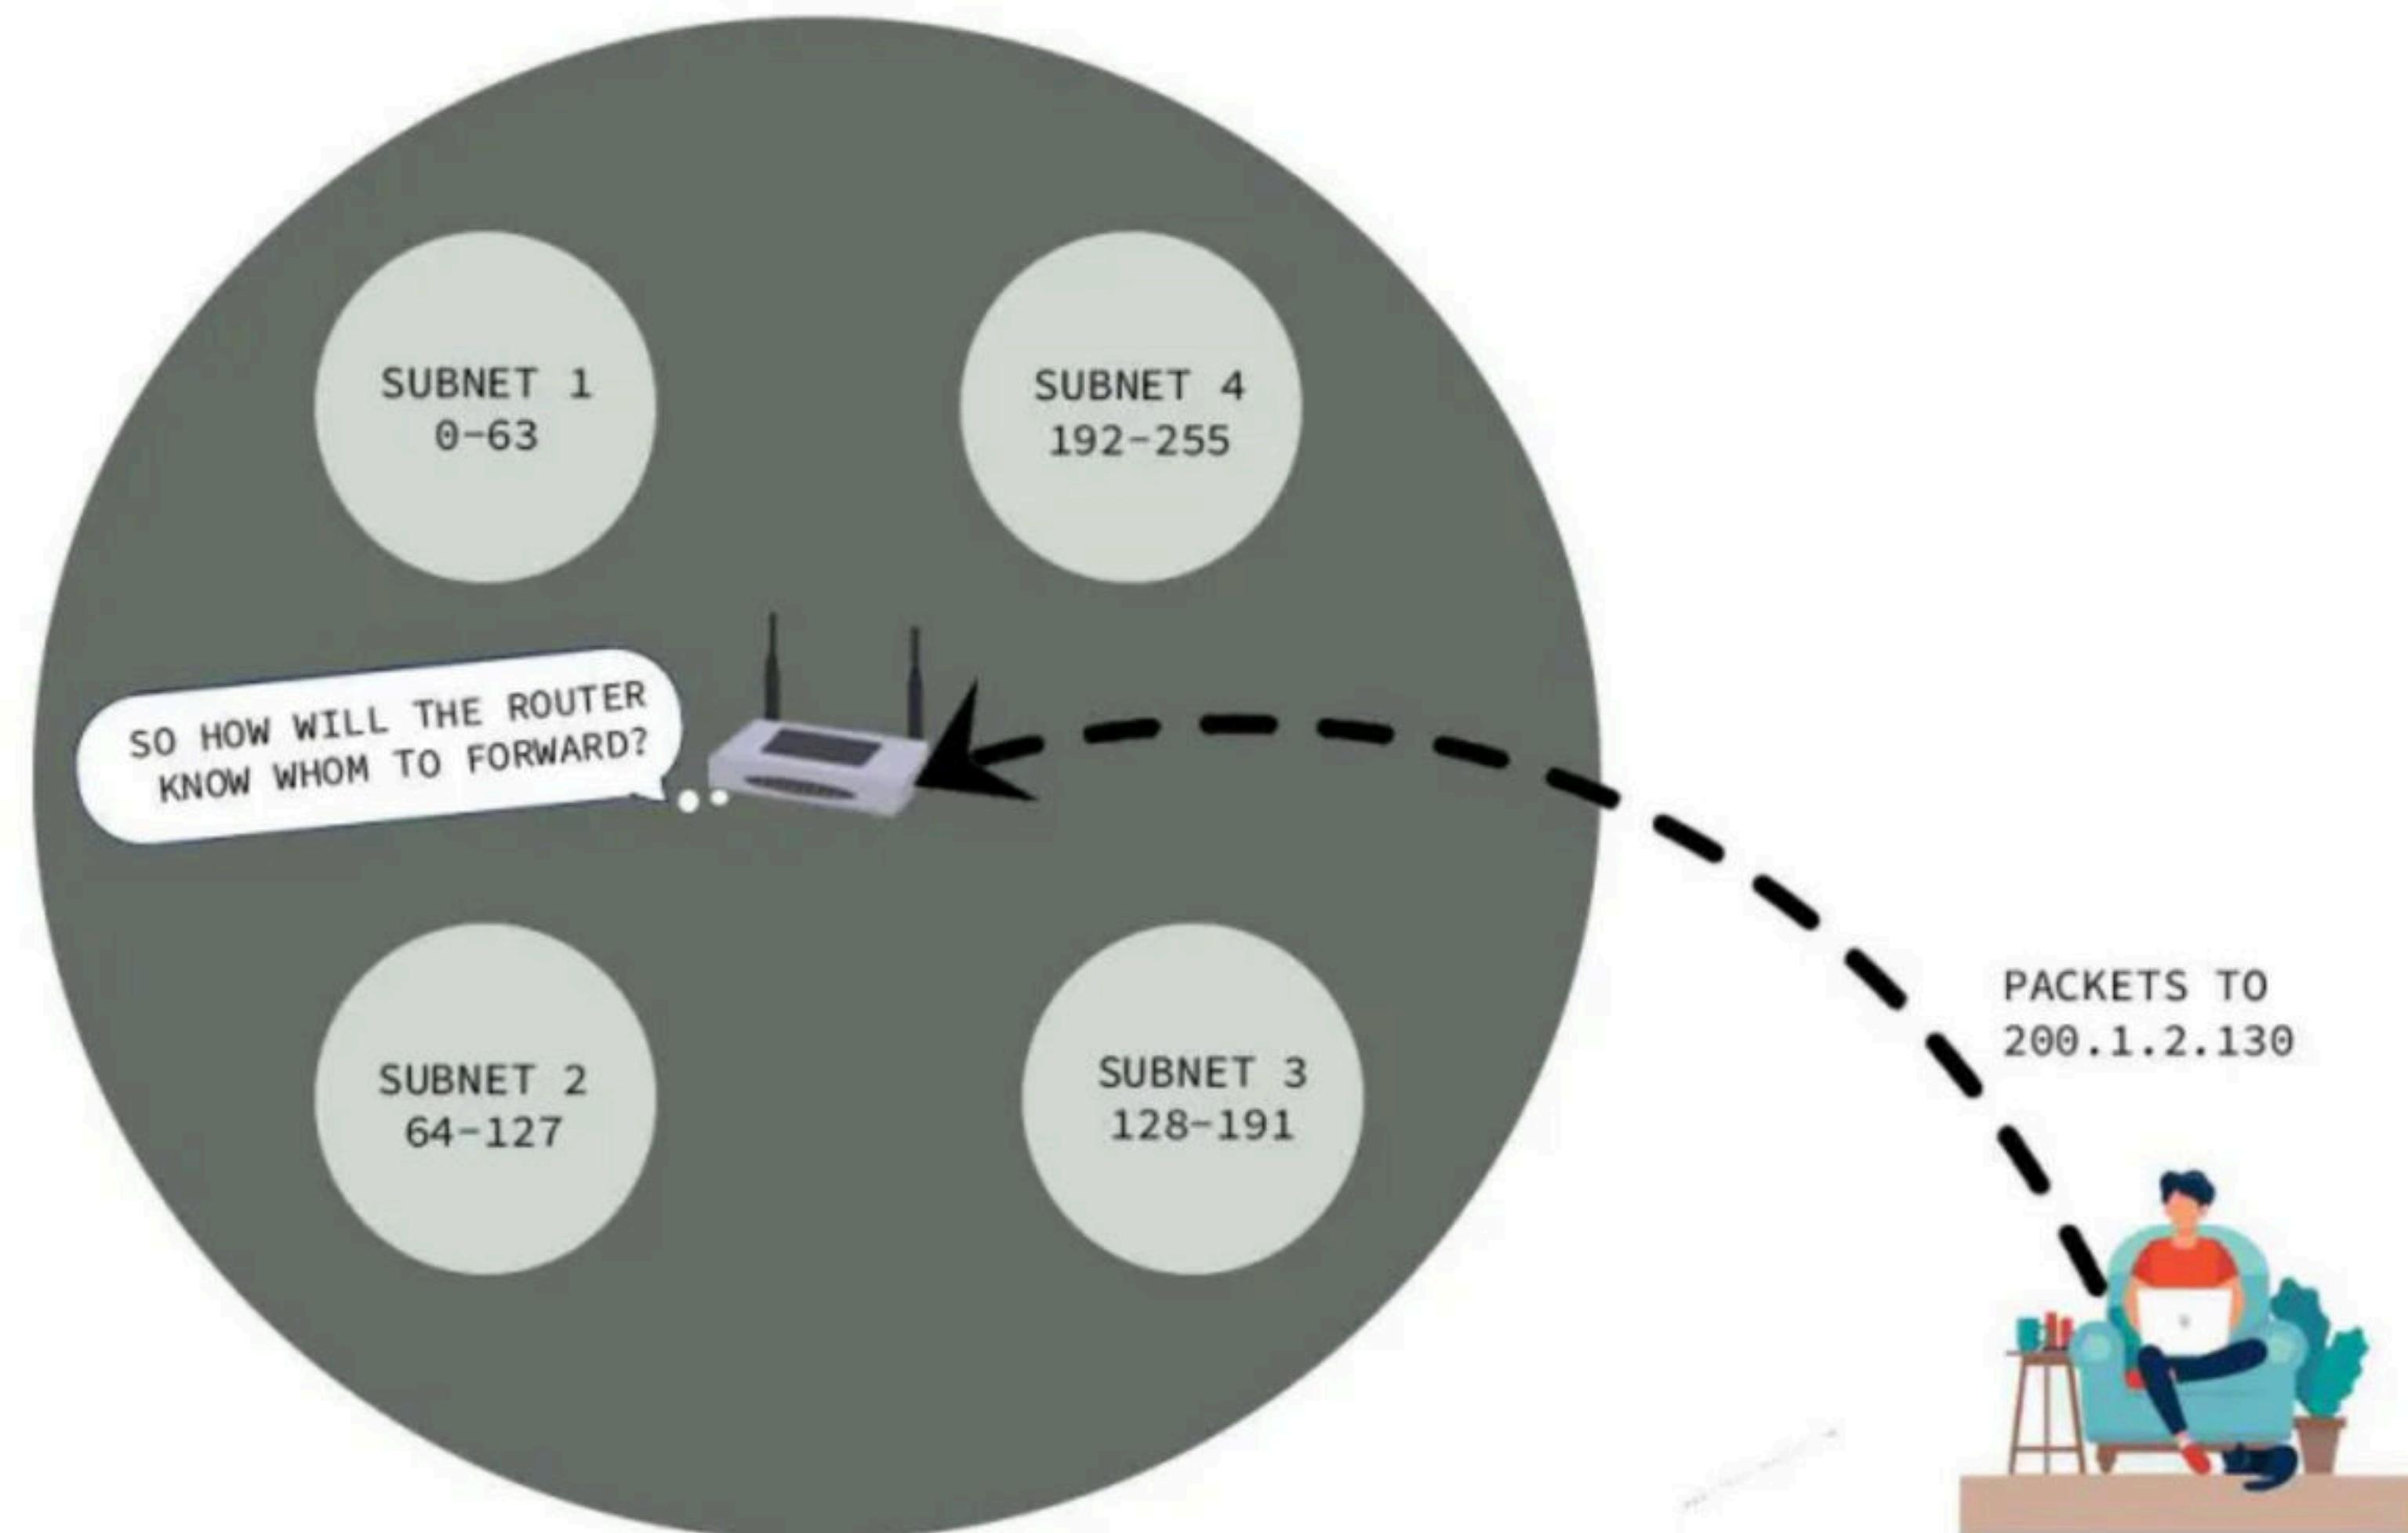

- IP Address of the subnet = 200.1.2.128
- Total number of IP Addresses = $2^6 = 64$
- Total number of hosts that can be configured = $64 - 2 = 62$
- Range of IP Addresses = [200.1.2.**10000000**, 200.1.2.**10111111**] = [200.1.2.128, 200.1.2.191]
- Direct Broadcast Address = 200.1.2.**10111111** = 200.1.2.191
- Limited Broadcast Address = 255.255.255.255

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

Let us see a scenario,

200.1.2.0

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

Subnet mask

Subnet mask is a 32 bit number which is a sequence of 1's followed by a sequence of 0's where-

NID + SID = NUMBER OF 1'S

HID = NUMBER OF 0'S

Previous example
was of Class C network where
NID = 24 bits and HID = 8 bits
after subnetting
NID+SID = 26 bits and HID = 6 bits

Therefore,

Subnet mask = 11111111.11111111.11111111.11000000

NID+SID

HID

=> 255.255.255.192

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

SUBNET MASK AND IP ADDRESS

= NID TO WHICH
THE IP BELONGS

EXAMPLE

IP ADDRESS = 200.1.2.130

SUBNET MASK = 255.255.255.192

SUBNET MASK: 11111111.11111111.11111111.11000000

IP: 11001000.00000001.00000010.10000010

11001000.00000001.00000010.10000000

200.1.2.128

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

IP ADDRESS = 200.1.2.130
BNET MASK = 255.255.255.192

SUBNET MASK: 11111111.11111111.11111111.11000000

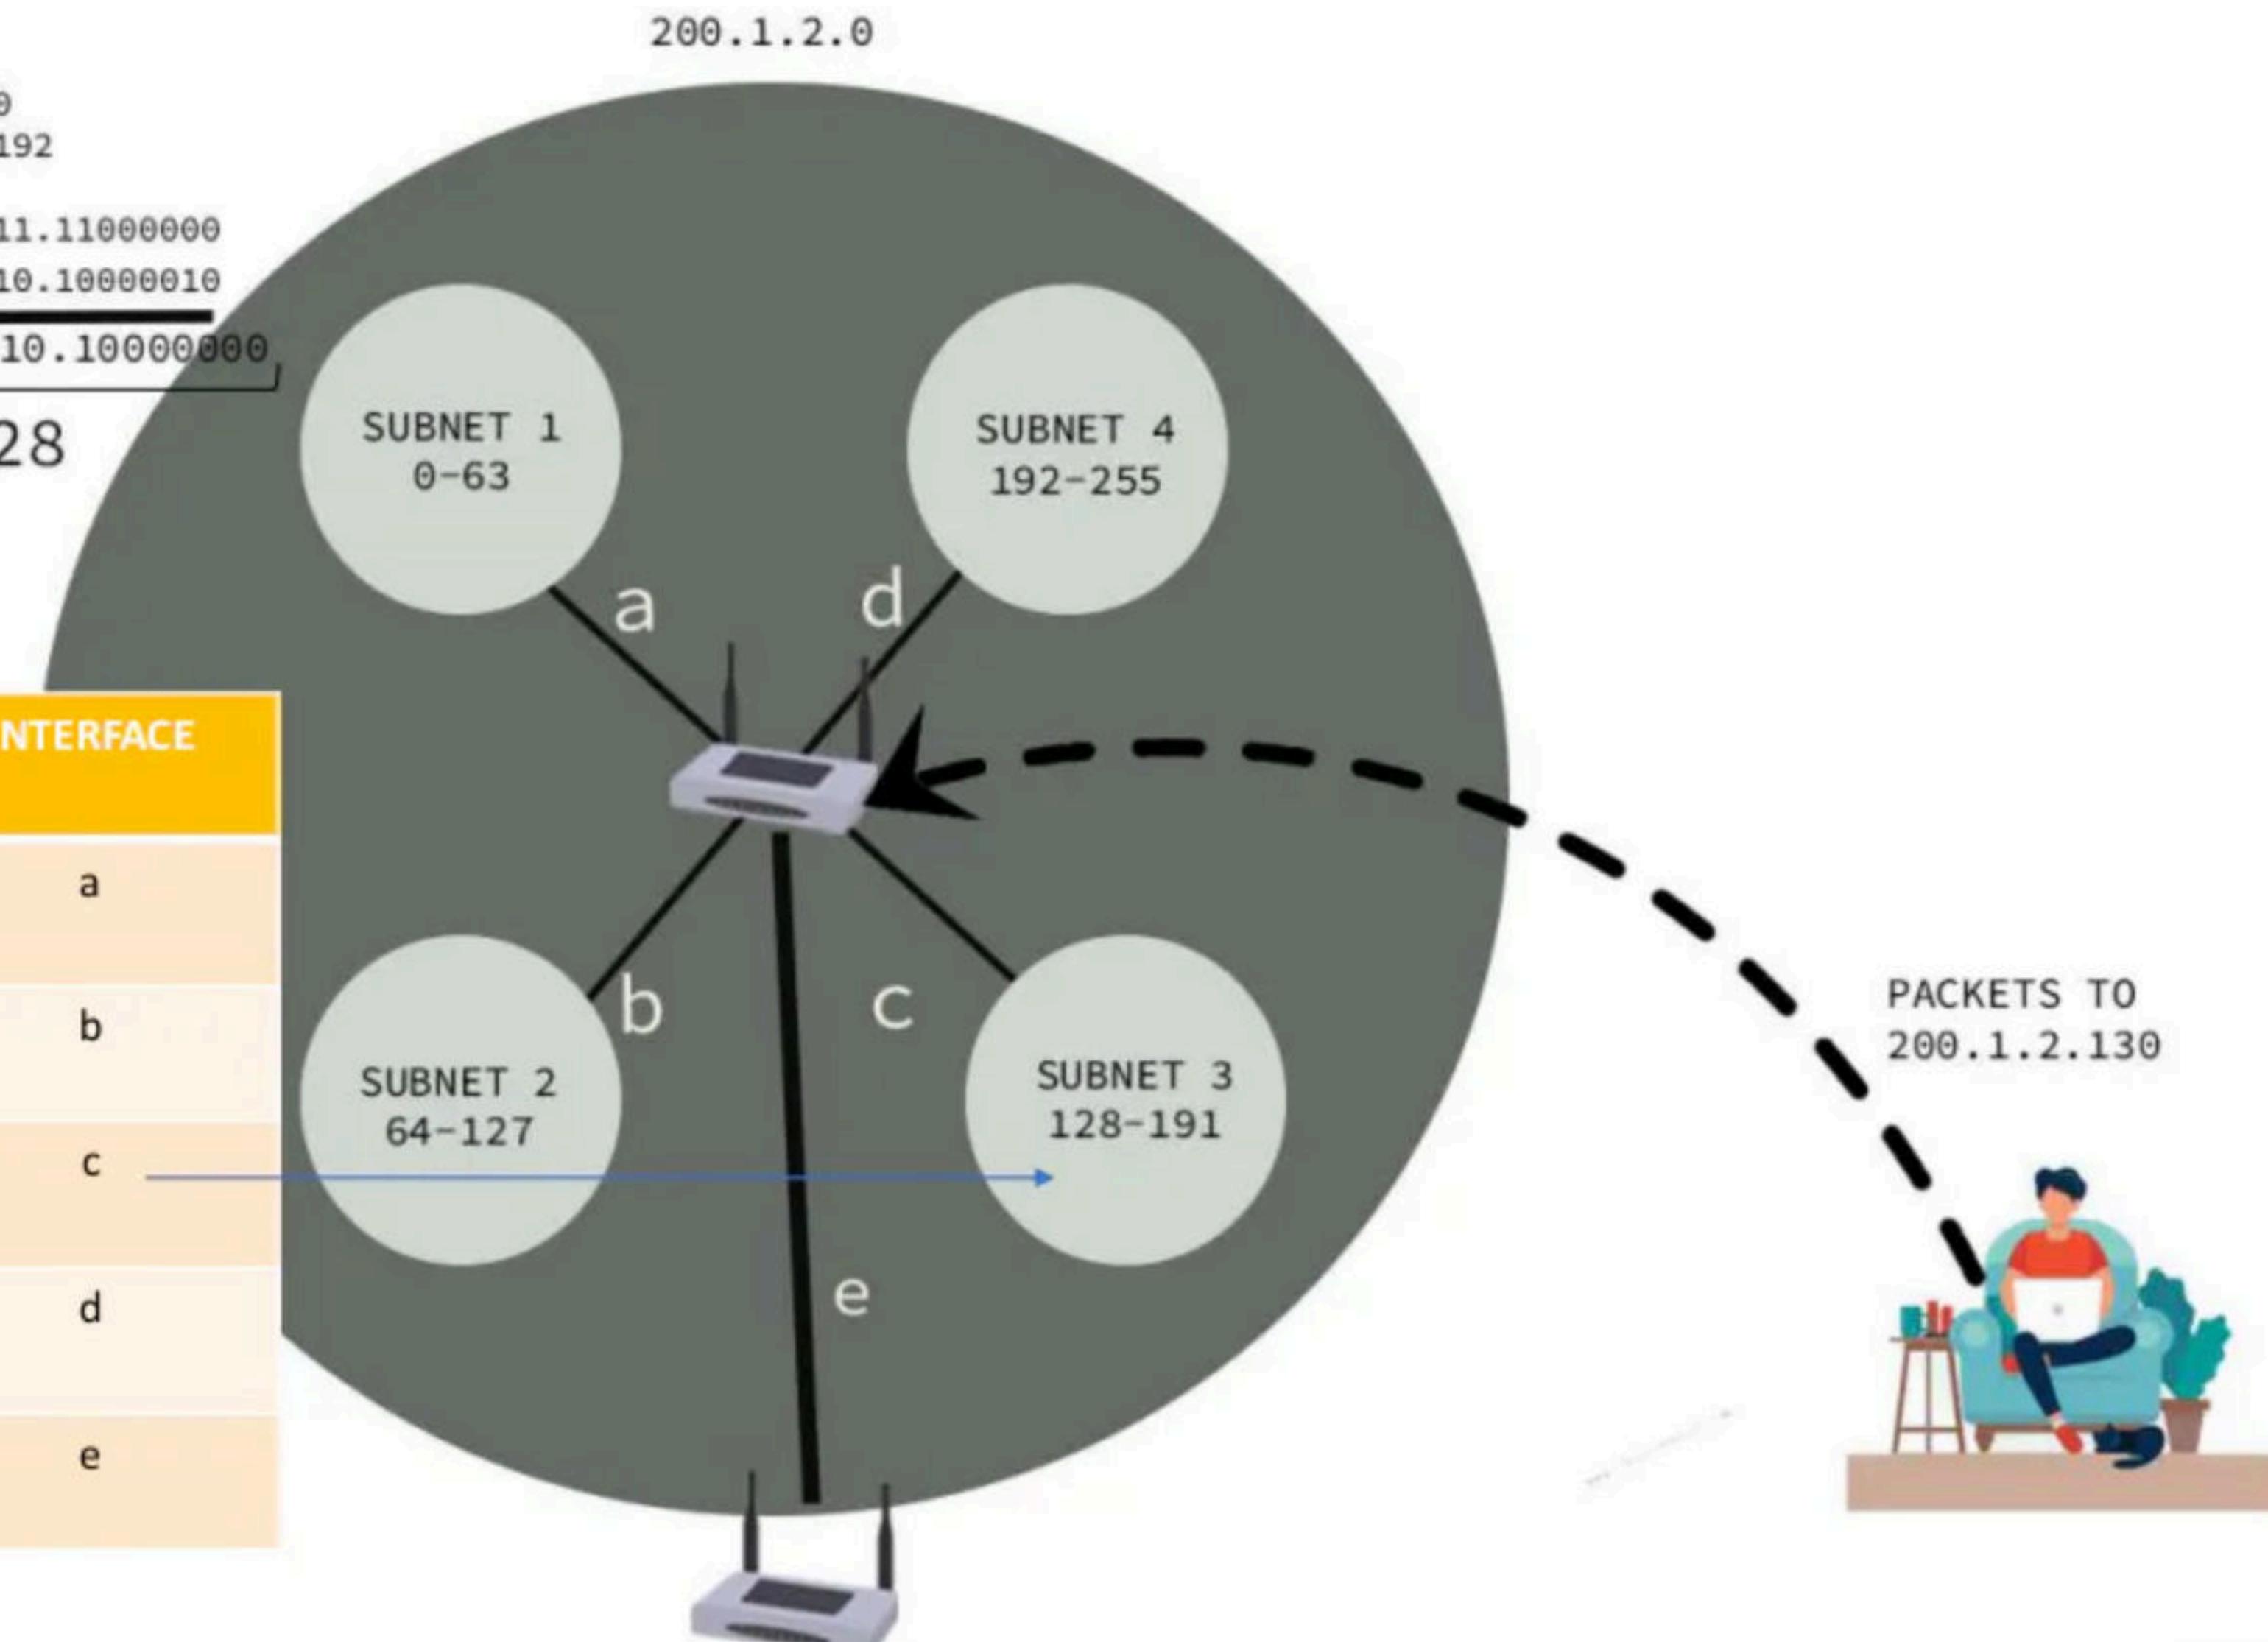

IP: 11001000.00000001.00000010.10000010

11001000.0000001.00000010.10000000

200.1.2.128

ROUTING TABLE

NID	SUBNET MASK	INTERFACE
200.1.2.0	255.255.255.192	a
200.1.2.64	255.255.255.192	b
200.1.2.128	255.255.255.192	c _____
200.1.2.192	255.255.255.192	d
0.0.0.0	0.0.0.0	e

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

Consider three machines M, N, and P with IP addresses 100.10.5.2, 100.10.5.5, and 100.10.5.6 respectively. The subnet mask is set to 255.255.255.252 for all the three machines. Which one of the following is true?

- A.) M, N, and P all belong to the same subnet
- B.) Only M and N belong to the same subnet
- C.) M, N, and P belong to three different subnets
- D.) Only N and P belong to the same subnet

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

SOLUTION:

First, we will do bitwise AND between Subnet mask and given IP address one by one

For M: 100.10.5.2

Bitwise AND:

01100100.00001010.00000101.00000010 (100.10.5.2)

AND 11111111.11111111.11111111.11111100 (255.255.255.252)

= 01100100.00001010.00000101.00000000 (100.10.5.0)

For N: 100.10.5.5

Bitwise AND:

01100100.00001010.00000101.00000101 (100.10.5.5)

AND 11111111.11111111.11111111.11111100 (255.255.255.252)

= 01100100.00001010.00000101.00000100 (100.10.5.4)

For P: 100.10.5.6

Bitwise AND:

01100100.00001010.00000101.00000110 (100.10.5.6)

AND 11111111.11111111.11111111.11111100 (255.255.255.252)

= 01100100.00001010.00000101.00000100 (100.10.5.4)

It is sure from the above computation that N and P belong to the same network (i.e., 100.10.5.4), while M can belong to the same network or it can be from any other network.

So, option (D) is correct.

Advantages

It improves the security.

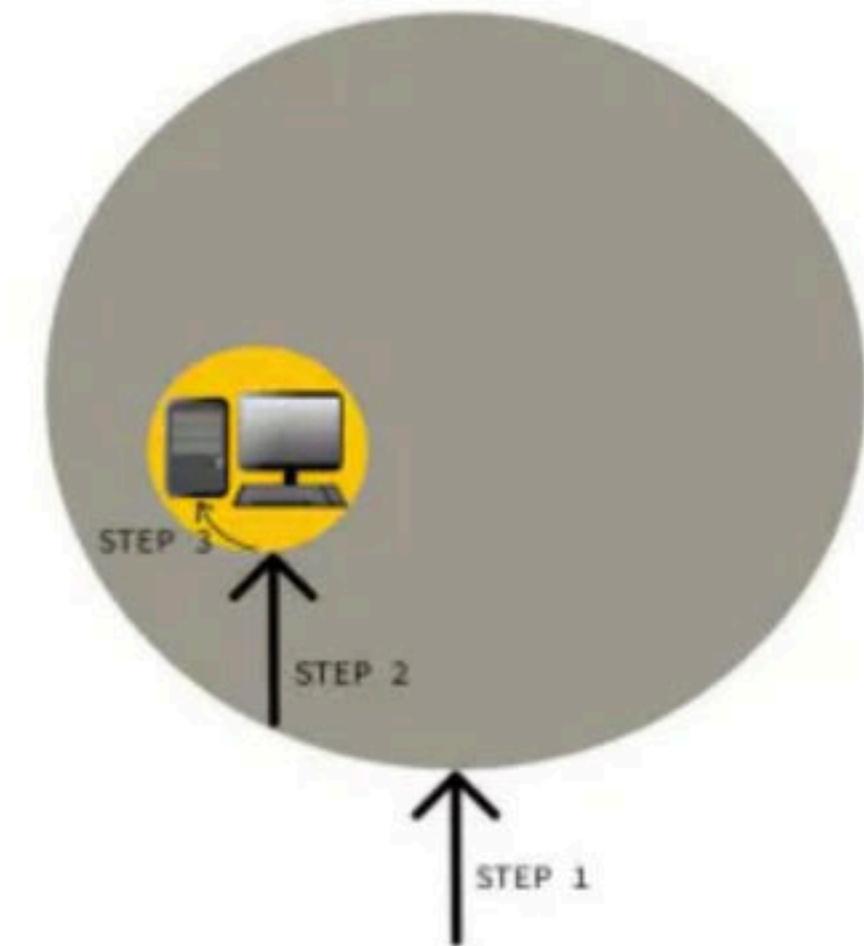

The maintenance of subnets is easy.

Disadvantages

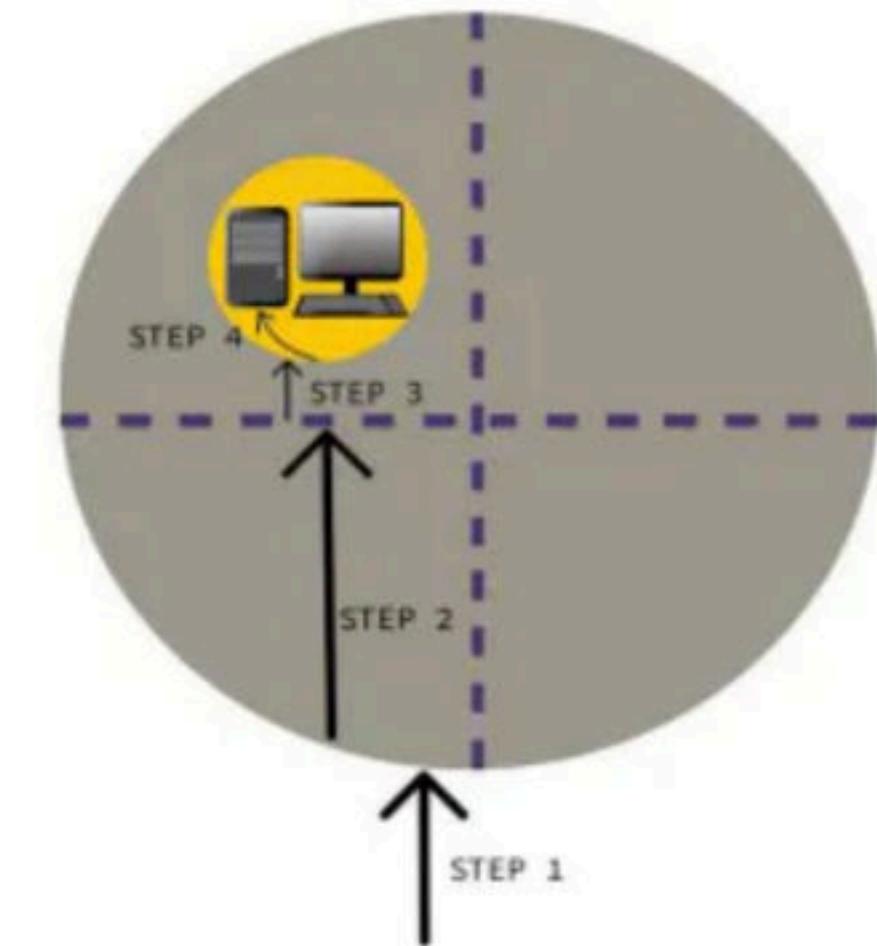

After subnetting, the communication process becomes complex involving the following 4 steps-

- Identifying the network
- Identifying the sub network
- Identifying the host
- Identifying the process

REACHING A HOST WITHOUT SUBNETTING

REACHING A HOST WITH SUBNETTING

Computer Networks

Subnet Masking question

SUBNET MASK	NO OF HOSTS	SUBNETS IN CLASS A	SUBNETS IN CLASS B	SUBNETS IN CLASS C

When any host connects to the internet, ISP provides following 4 things to the host-

1. IP Address-

ISP assigns an IP Address to the host so that it can be uniquely identified on the Internet.

2. Default Gateway-

Default router connected to the network in which the host is present is the default gateway for the host.

3. Subnet Mask-

Subnet mask is a 32 bit number that is assigned to the host.

It is used to determine to which network the given IP Address belongs to.

4. Domain Name Service (DNS)-

Domain Name Service (DNS) is used to translate the domain name into an IP Address.

RAVINDRABABU RAVULA

RAVINDRABABU RAVULA

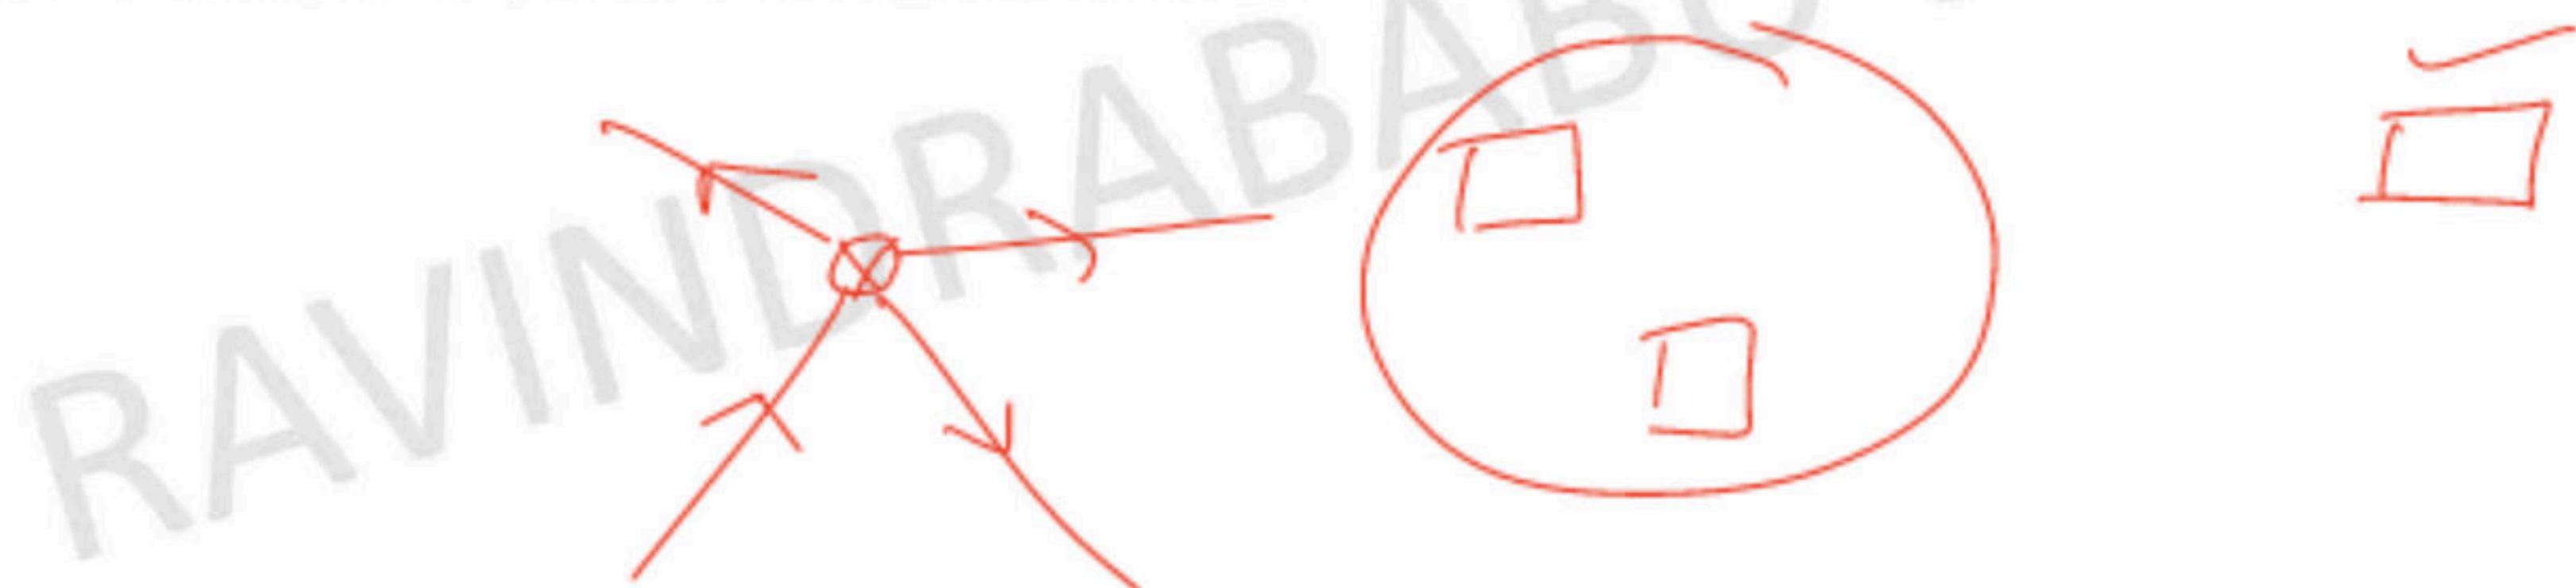

Subnet mask is used to determine to which network the given IP Address belongs to.

Host use its subnet mask to determine whether the other host it wants to communicate with is present within the same network or not.

If the destination host is present within the same network, then source host sends the packet directly to the destination host.

If the destination host is present in some other network, then source host routes the packet to the default gateway (router).

Router then sends the packet to the destination host.

To determine whether destination host is present within the same network or not, source host follows the following steps-

To answer this Follow the following steps:

Step-01:

Source host computes its own network address using its own IP Address and subnet mask.

After computation, source host obtains its network address with respect to itself.

Step-02:

Source host computes the network address of destination host using destination IP Address and its own subnet mask.

After computation, source host obtains the network address of destination host with respect to itself.

Step-03:

Source host compares the two results obtained in the above steps. There are 2 cases:

Case-1:

If the results are same,

Source host assumes that the destination host is present within the same network.

Source host sends the packet directly to the destination host.

Case-2:

If the results are different,

Source host assumes that the destination host is present in some other network.

Source host sends the packet via router to the destination host.

Example 1:

A:

$I_a = 200.1.2.10$ ✓

$S_a = 255.255.255.128$ ✓

B:

$I_b = 200.1.2.69$

$S_b = 255.255.255.192$

Determine Whether host B is present within the same network of A or not.

What they think about their positions.

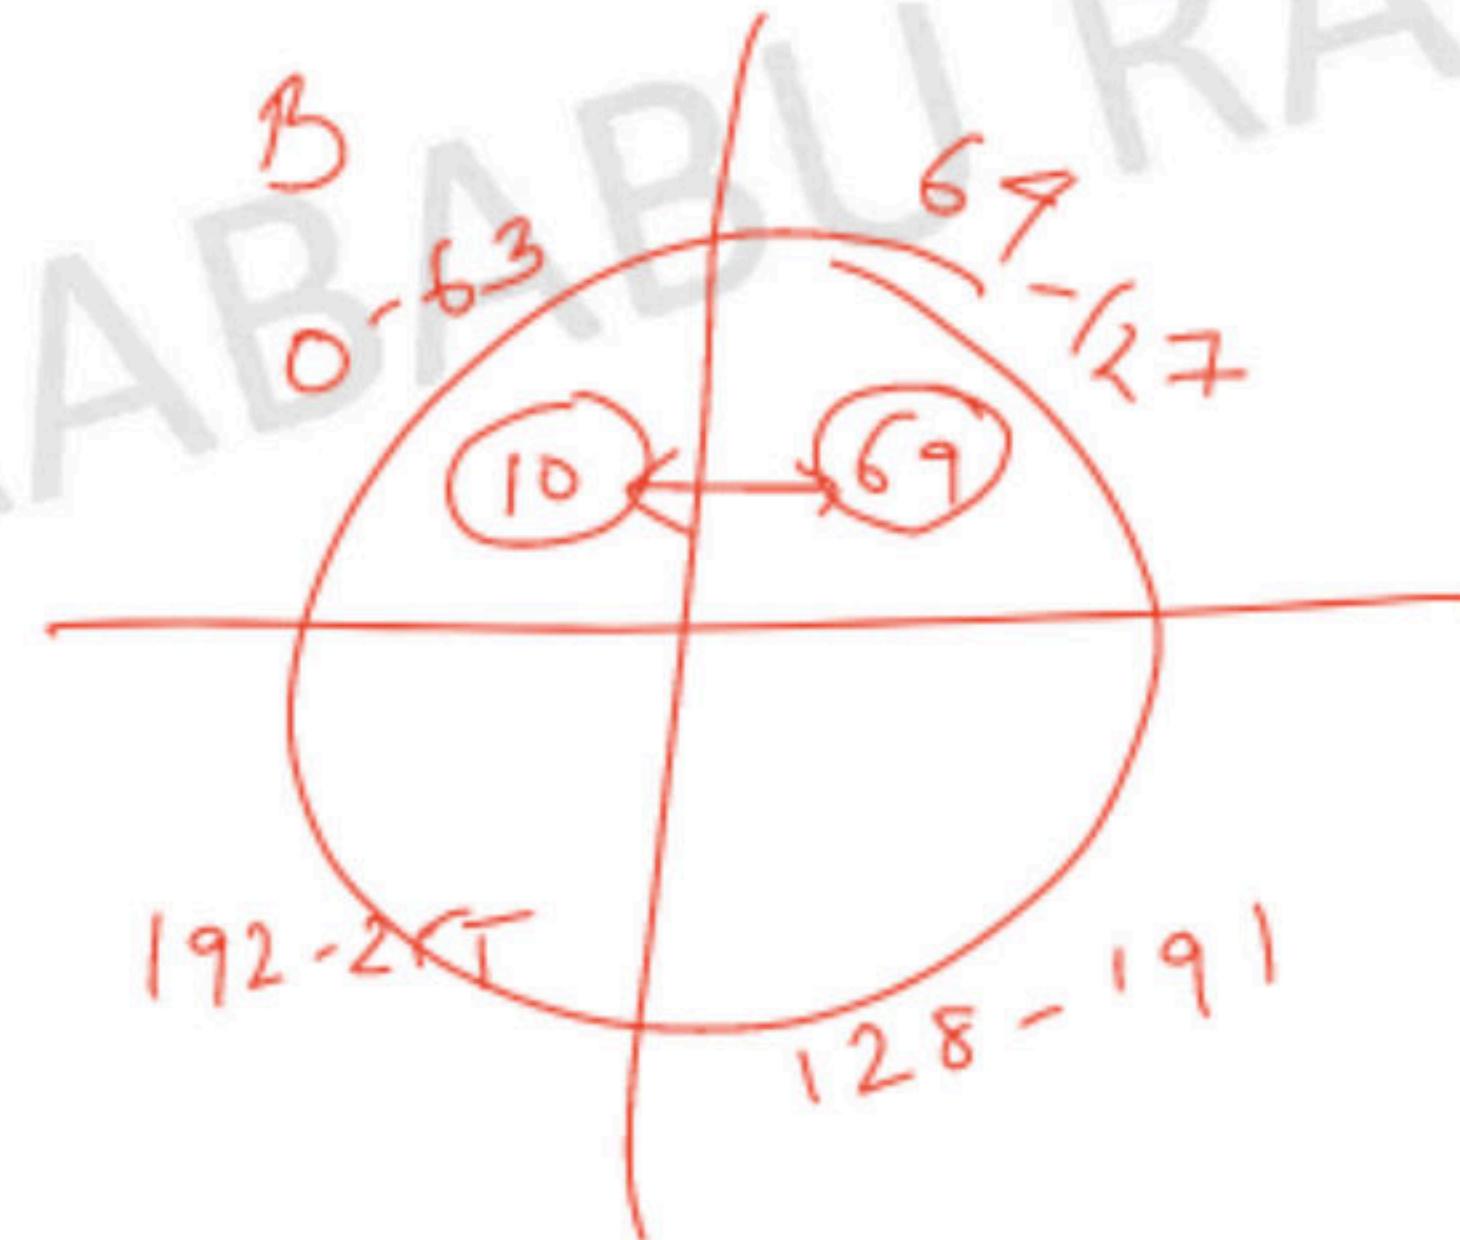

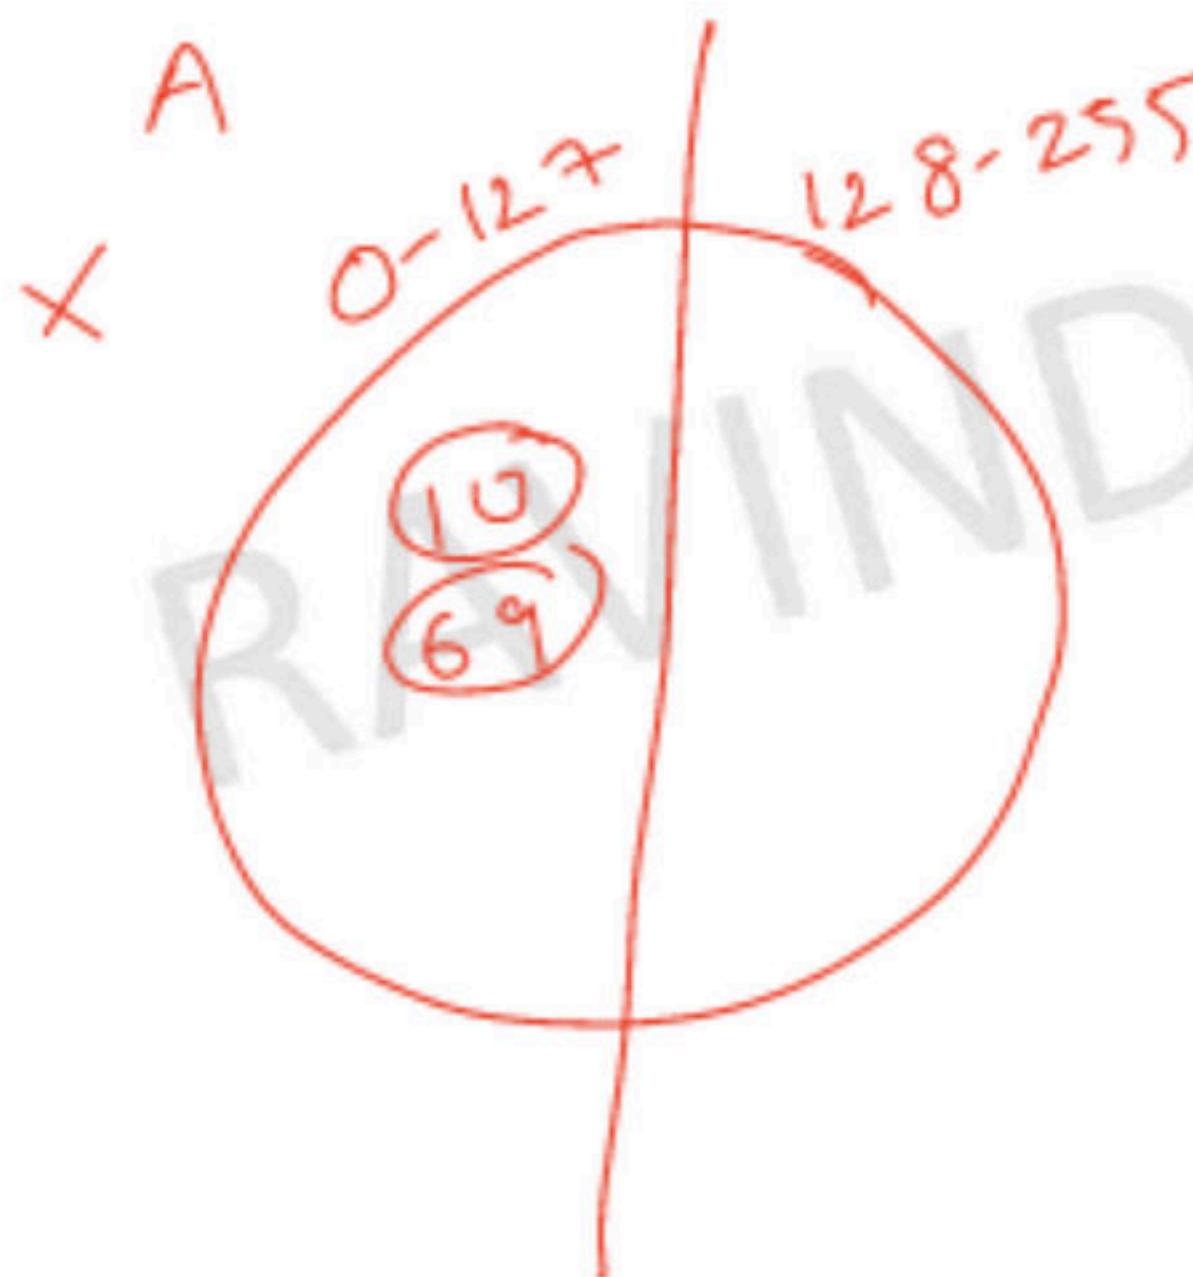

Diagram showing two circles labeled 'A'. The left circle contains I_P_A and S_{MA} . The right circle contains I_P_B and S_{MA} . Below the circles is the equation $NID_{AA} = NID_{BA}$, with a checkmark indicating the result is correct.

Example 1:

A:

Ia = 200.1.2.10

Sa = 255.255.255.128

B:

Ib = 200.1.2.69

Sb = 255.255.255.192

Determine Whether host B is present within the same network of A or not.

What they think about their positions.

Solution:

Ia : 11001000.00000001.00000010.00001010

Sa: 11111111.11111111.11111111.10000000

NIDaa : 11001000.00000001.00000010.00000000

200.1.2.0

Ib : 11001000.00000001.00000010.01000101

Sa: 11111111.11111111.11111111.10000000

NIDba : 11001000.00000001.00000010.00000000

=

200.1.2.0

According to A they are in same network

Example 1:

A:

I_a = 200.1.2.10

S_a = 255.255.255.128

B:

I_b = 200.1.2.69

S_b = 255.255.255.192

Determine Whether host B is present within the same network of A or not.

What they think about their positions.

Solution:

I_b : 11001000.00000001.00000010.01000101

S_b : 11111111.11111111.11111111.11000000

NIDb_a : 11001000.00000001.00000010.01000000

200.1.2.64

I_a : 11001000.00000001.00000010.00001010

S_a : 11111111.11111111.11111111.11000000

NIDa_b : 11001000.00000001.00000010.00000000

=

200.1.2.0

According to B they are in different network

Example 2:

SM : 255.255.255.255 ✓

IP = 200.1.2.3

What is NID?

Example 2:

SM : 255.255.255.255

IP = 200.1.2.3

What is NID?

Solution:

11001000.00000001.00000010.01000101

AND 11111111.11111111.11111111.11111111

11001000.00000001.00000010.01000101

IP address AND SM – 255.255.255.255 = IP address

Example 3:

If DBA = 200.1.15.255 which is a Classless IP

What is the Size of the NID ?

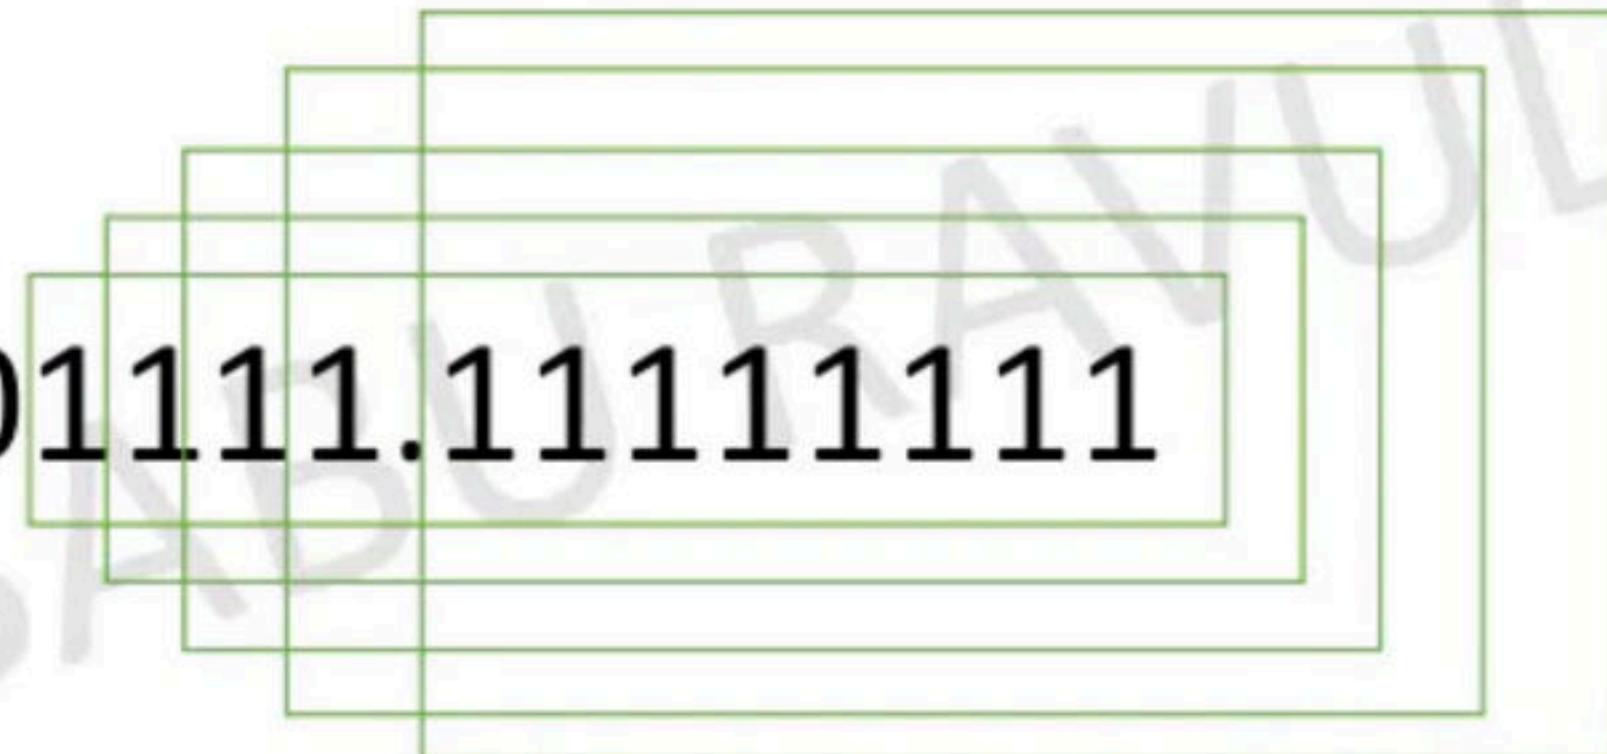

Example 3:

If DBA = 200.1.15.255 which is a Classless IP

What is the Size of the NID ?

There could be many possibilities
Since DBA contains all 1's in HID

11001000.00000001.00001111.11111111

Answer : NID = 20 or 21 or 22 orso on

Computer Networks

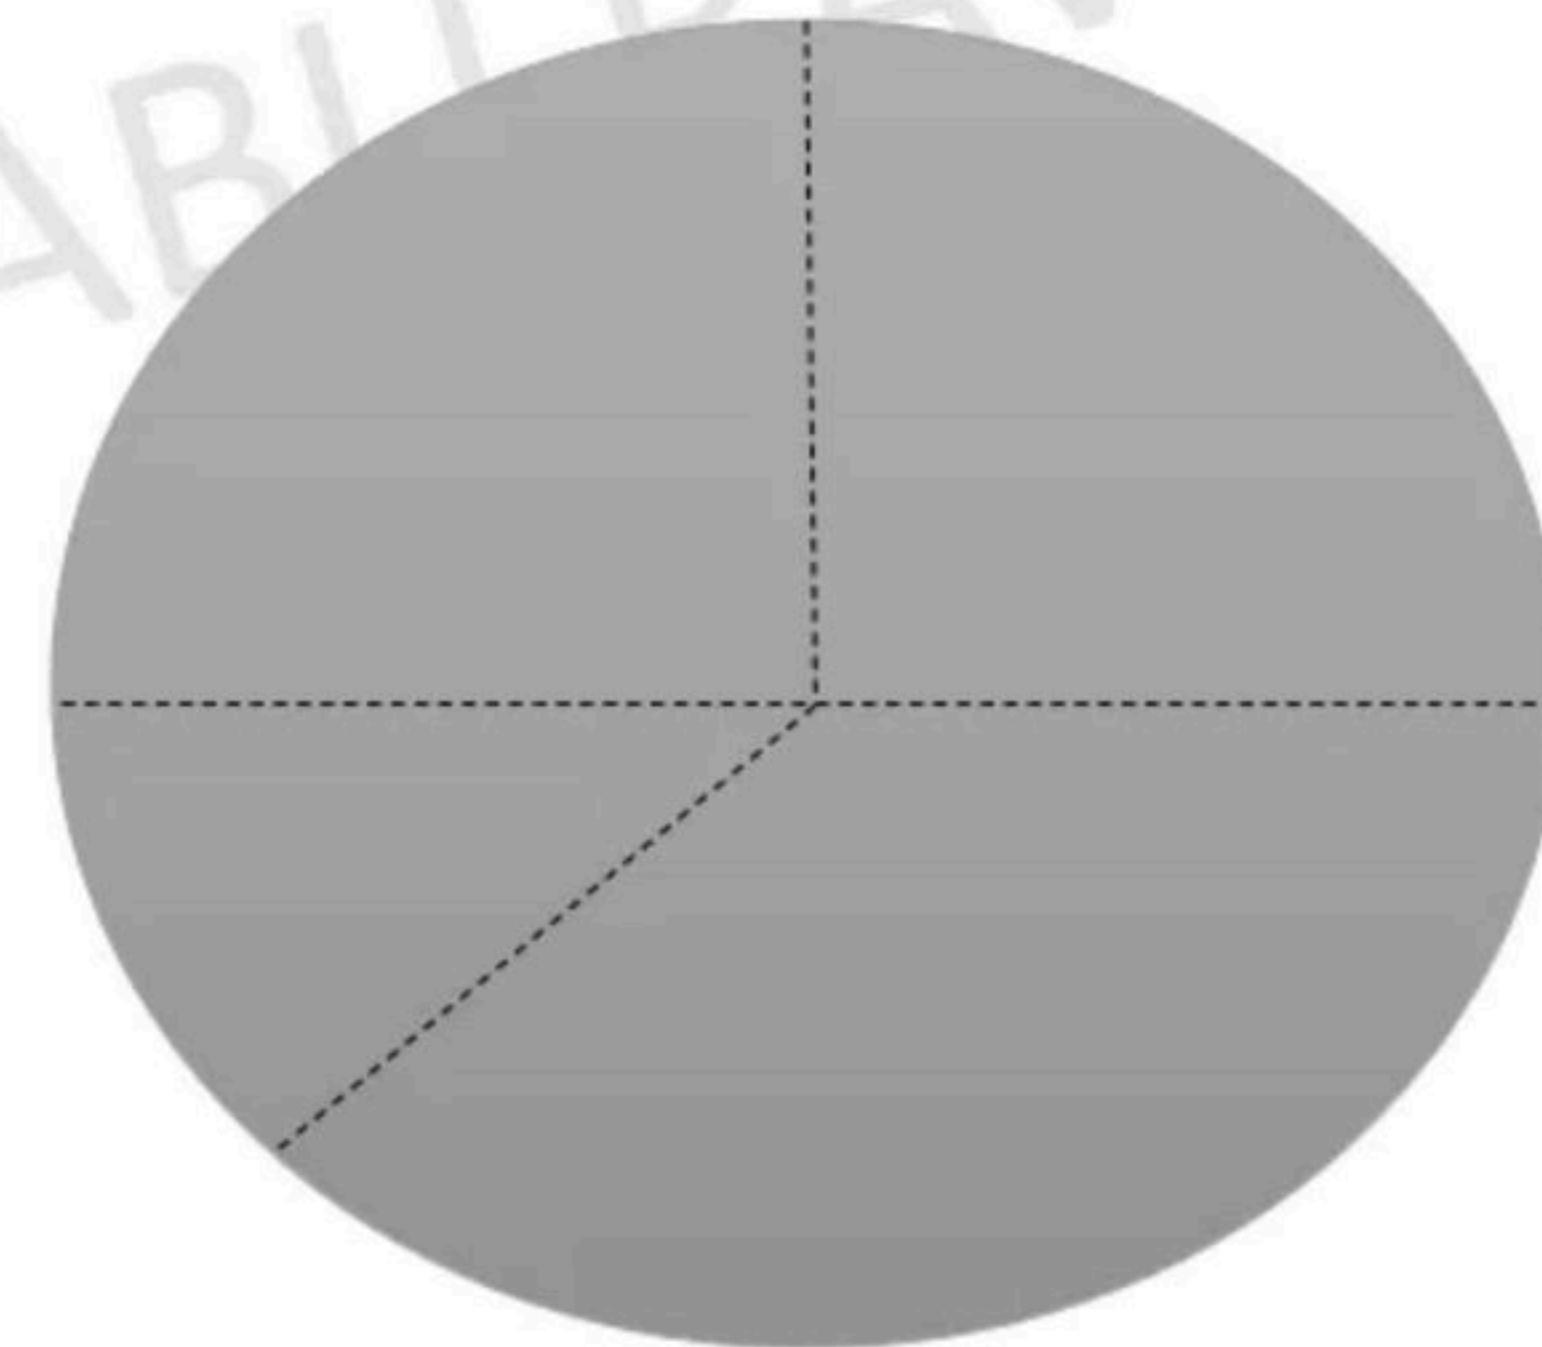

Variable Length Subnet Masking

Variable Length Subnetting

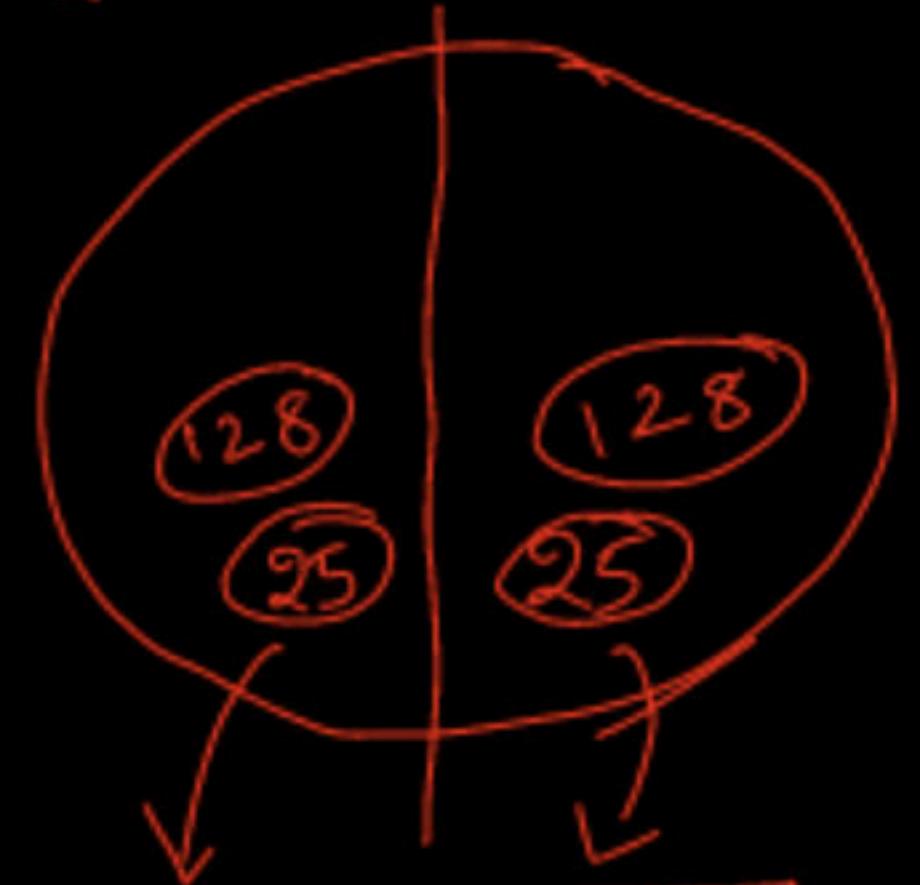

Variable length subnetting also called as classless subnetting divides the network into subnets where-

- All the subnets are not of same size.
- All the subnets do not have equal number of hosts.
- All the subnets do not have same subnet mask.

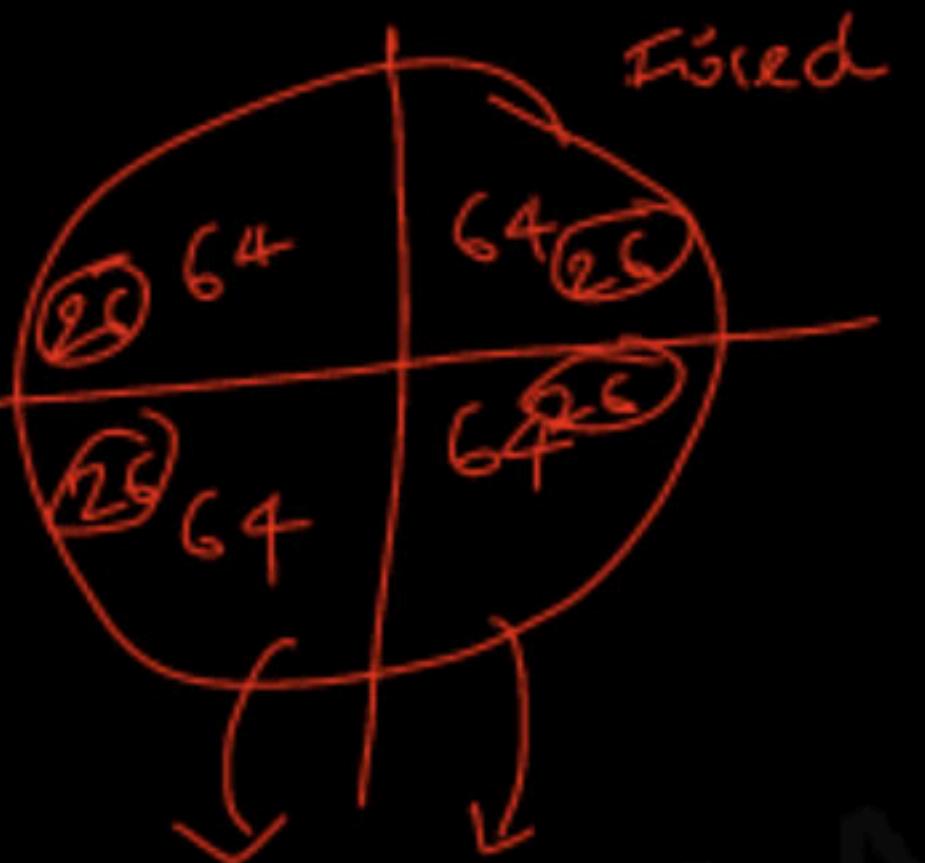

Let us take an Example

200.1.2.0

200.1.2.0

255.255.255.128

255.255.255.192

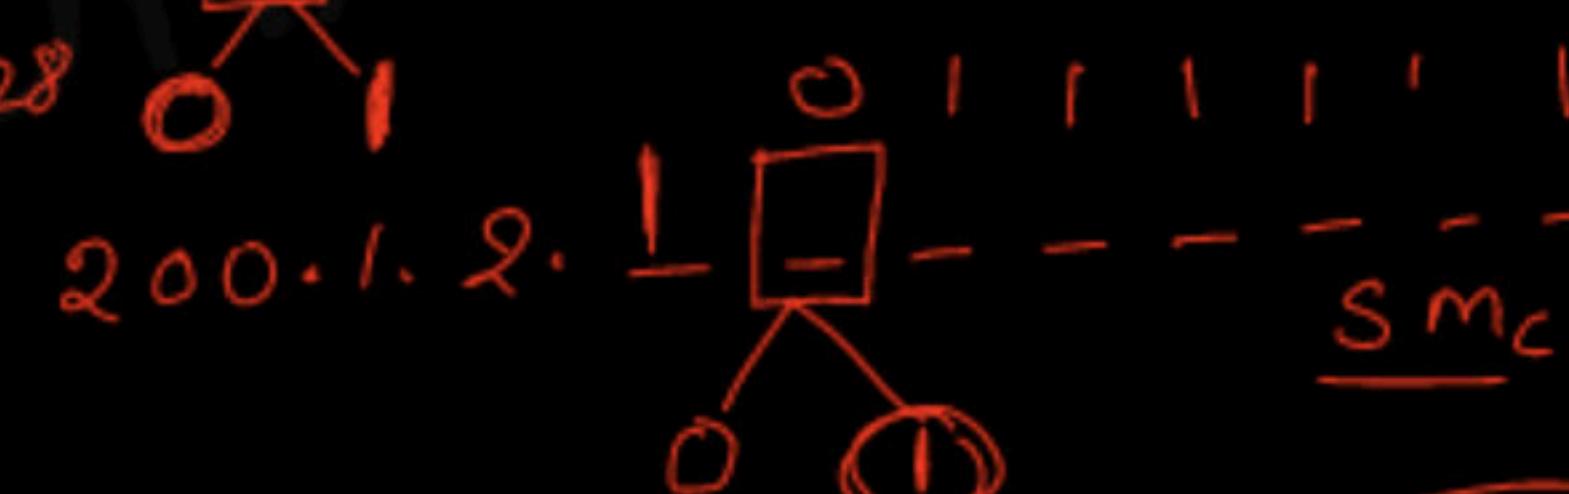

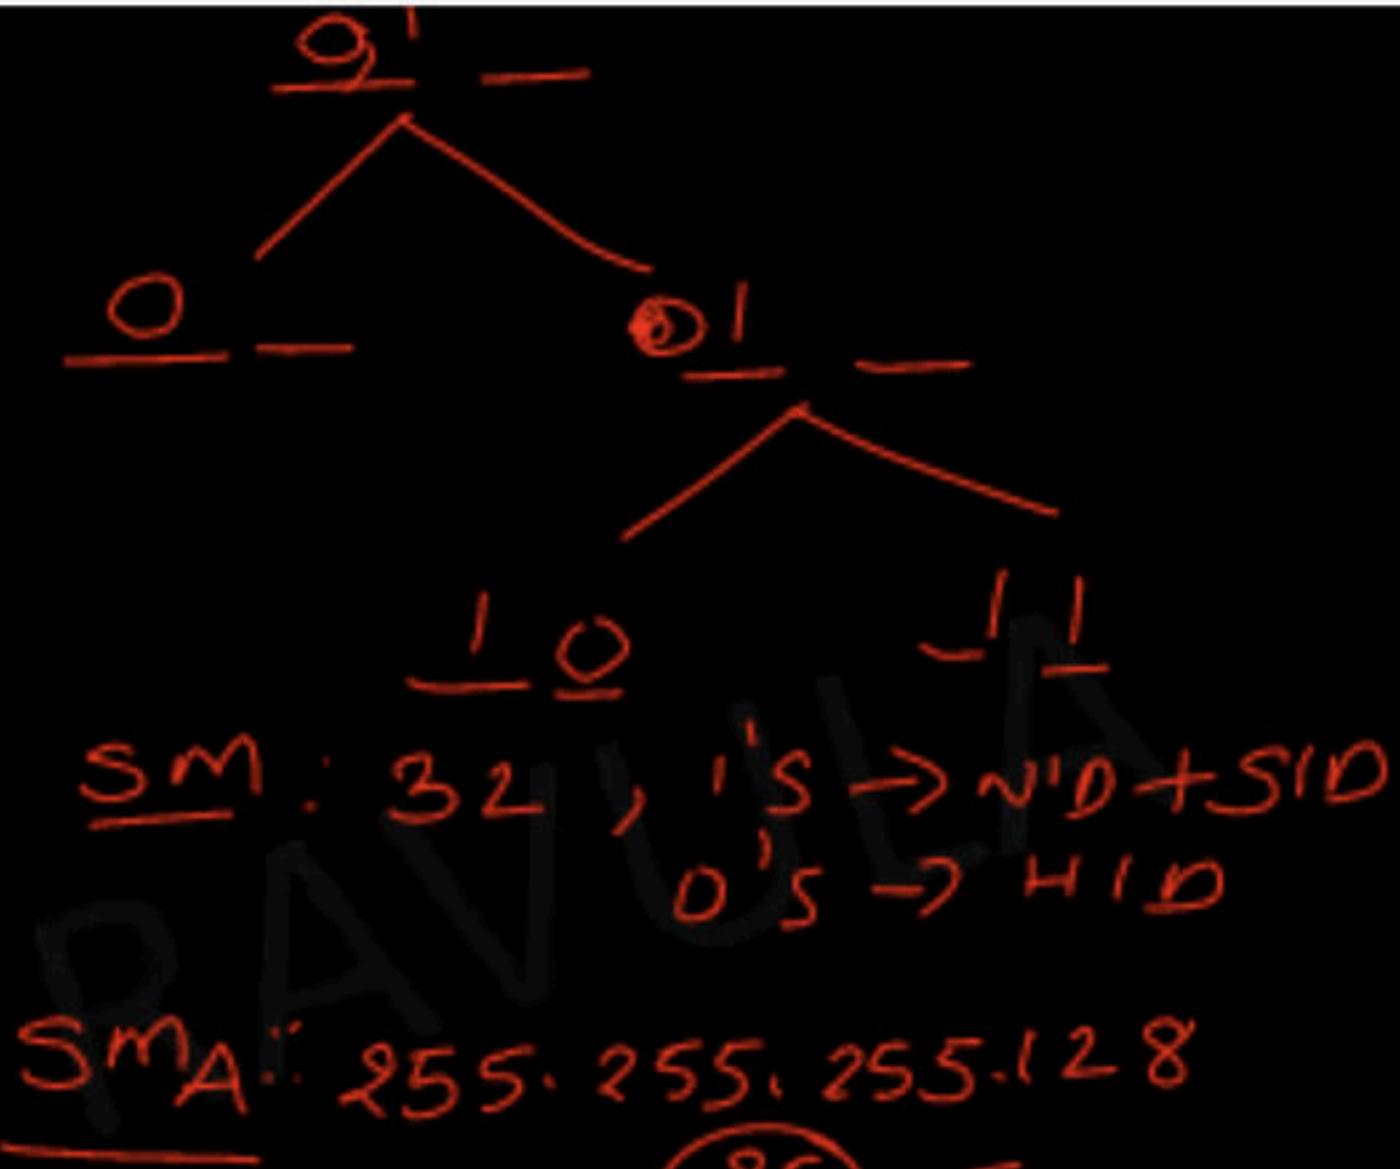

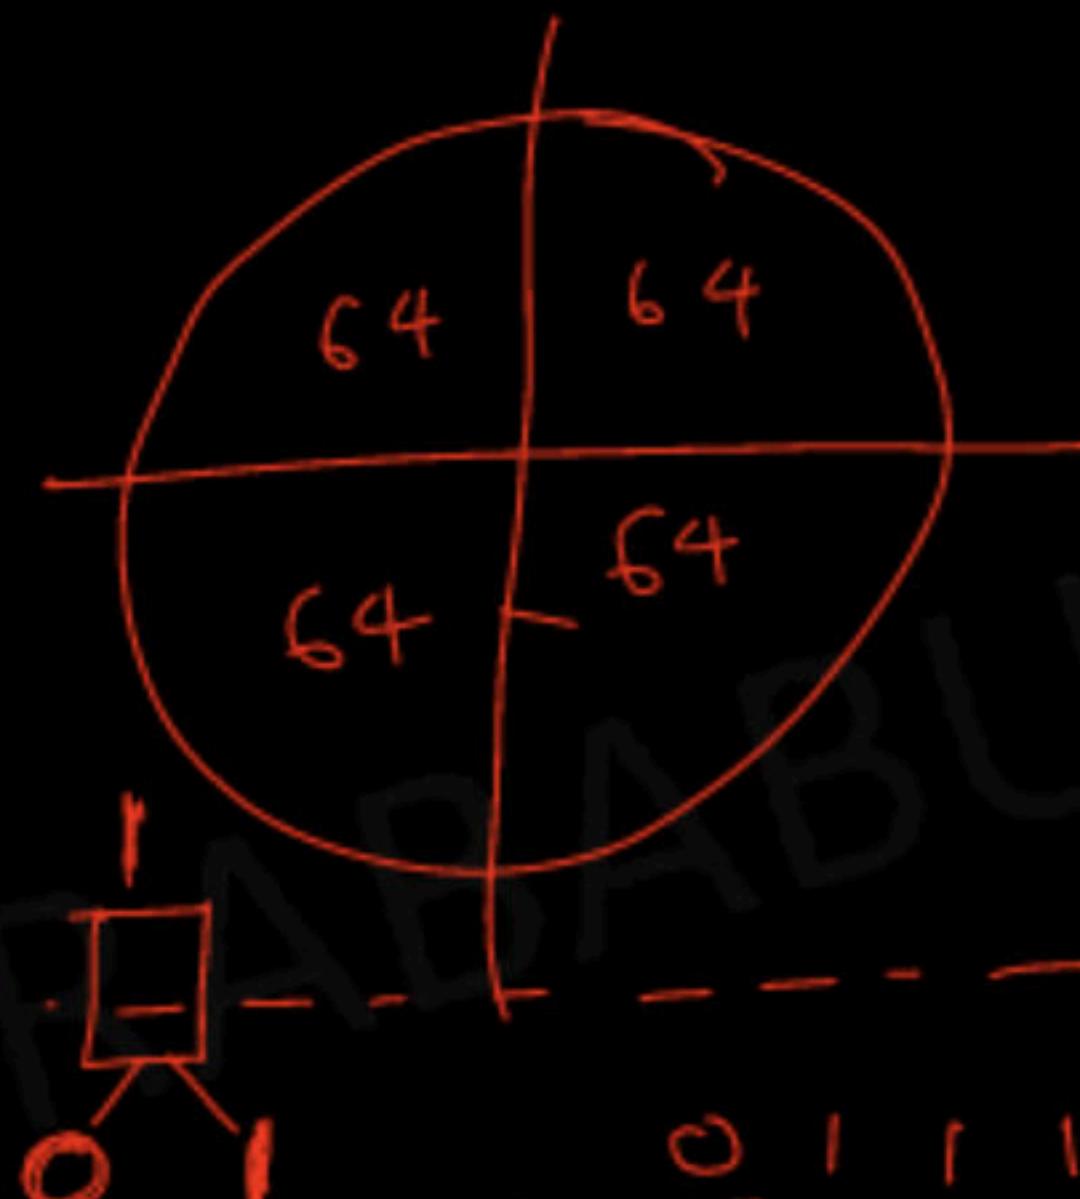

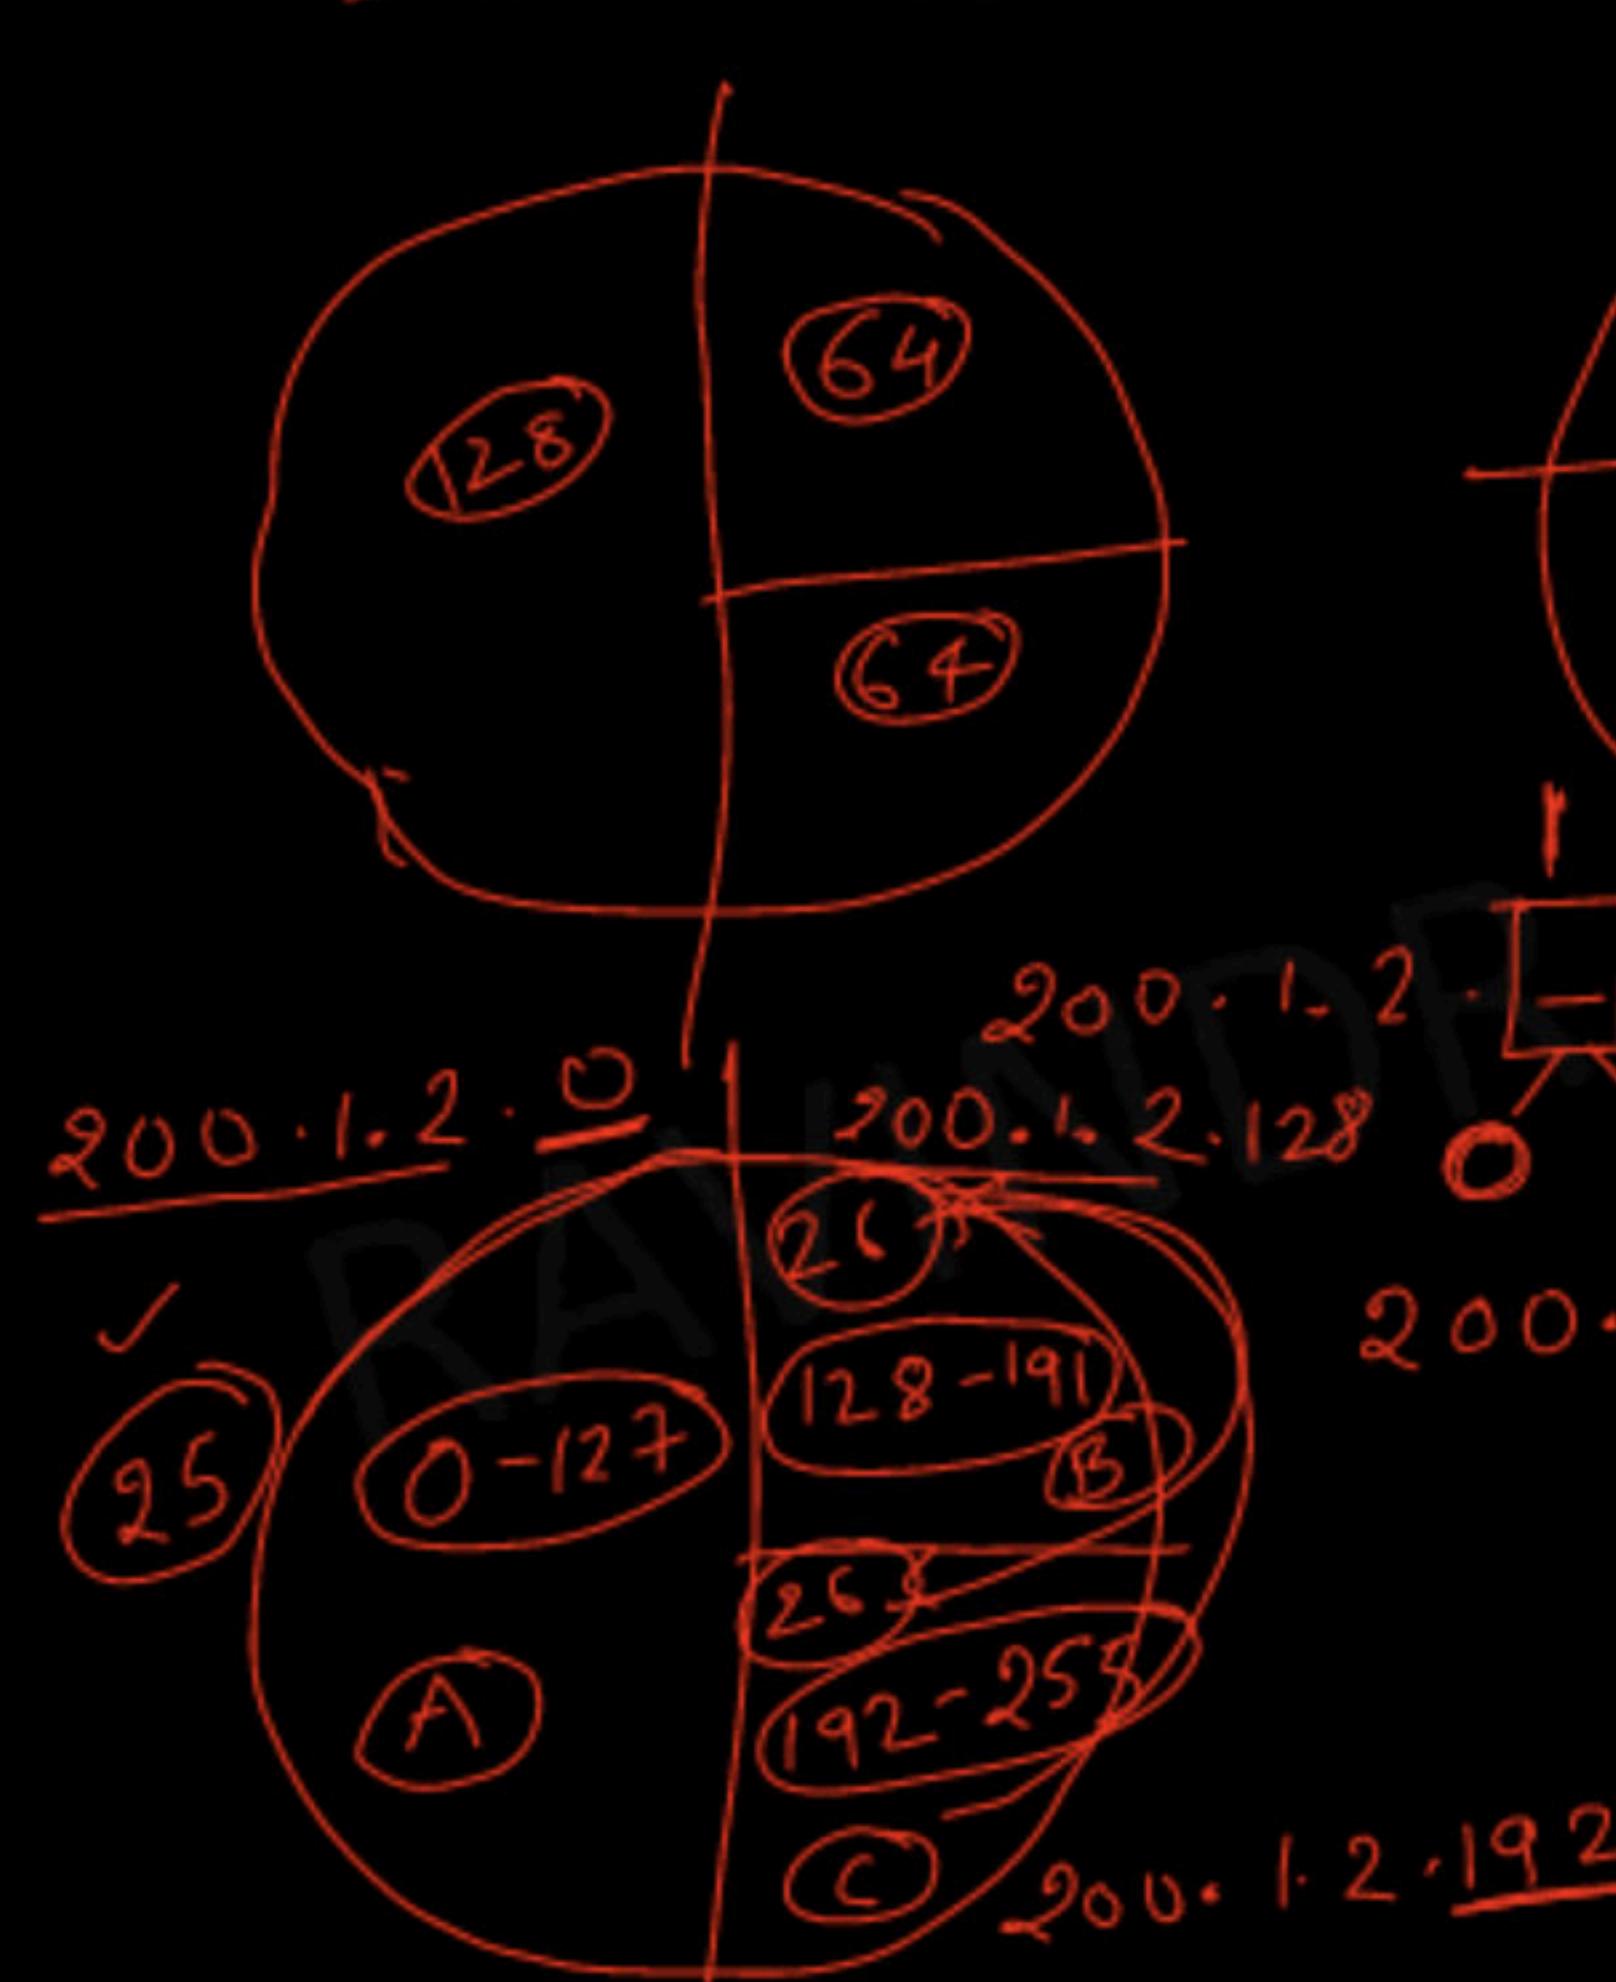

Size → Same

Sm → Same

FLSm - Fixed length Sm

VLSM

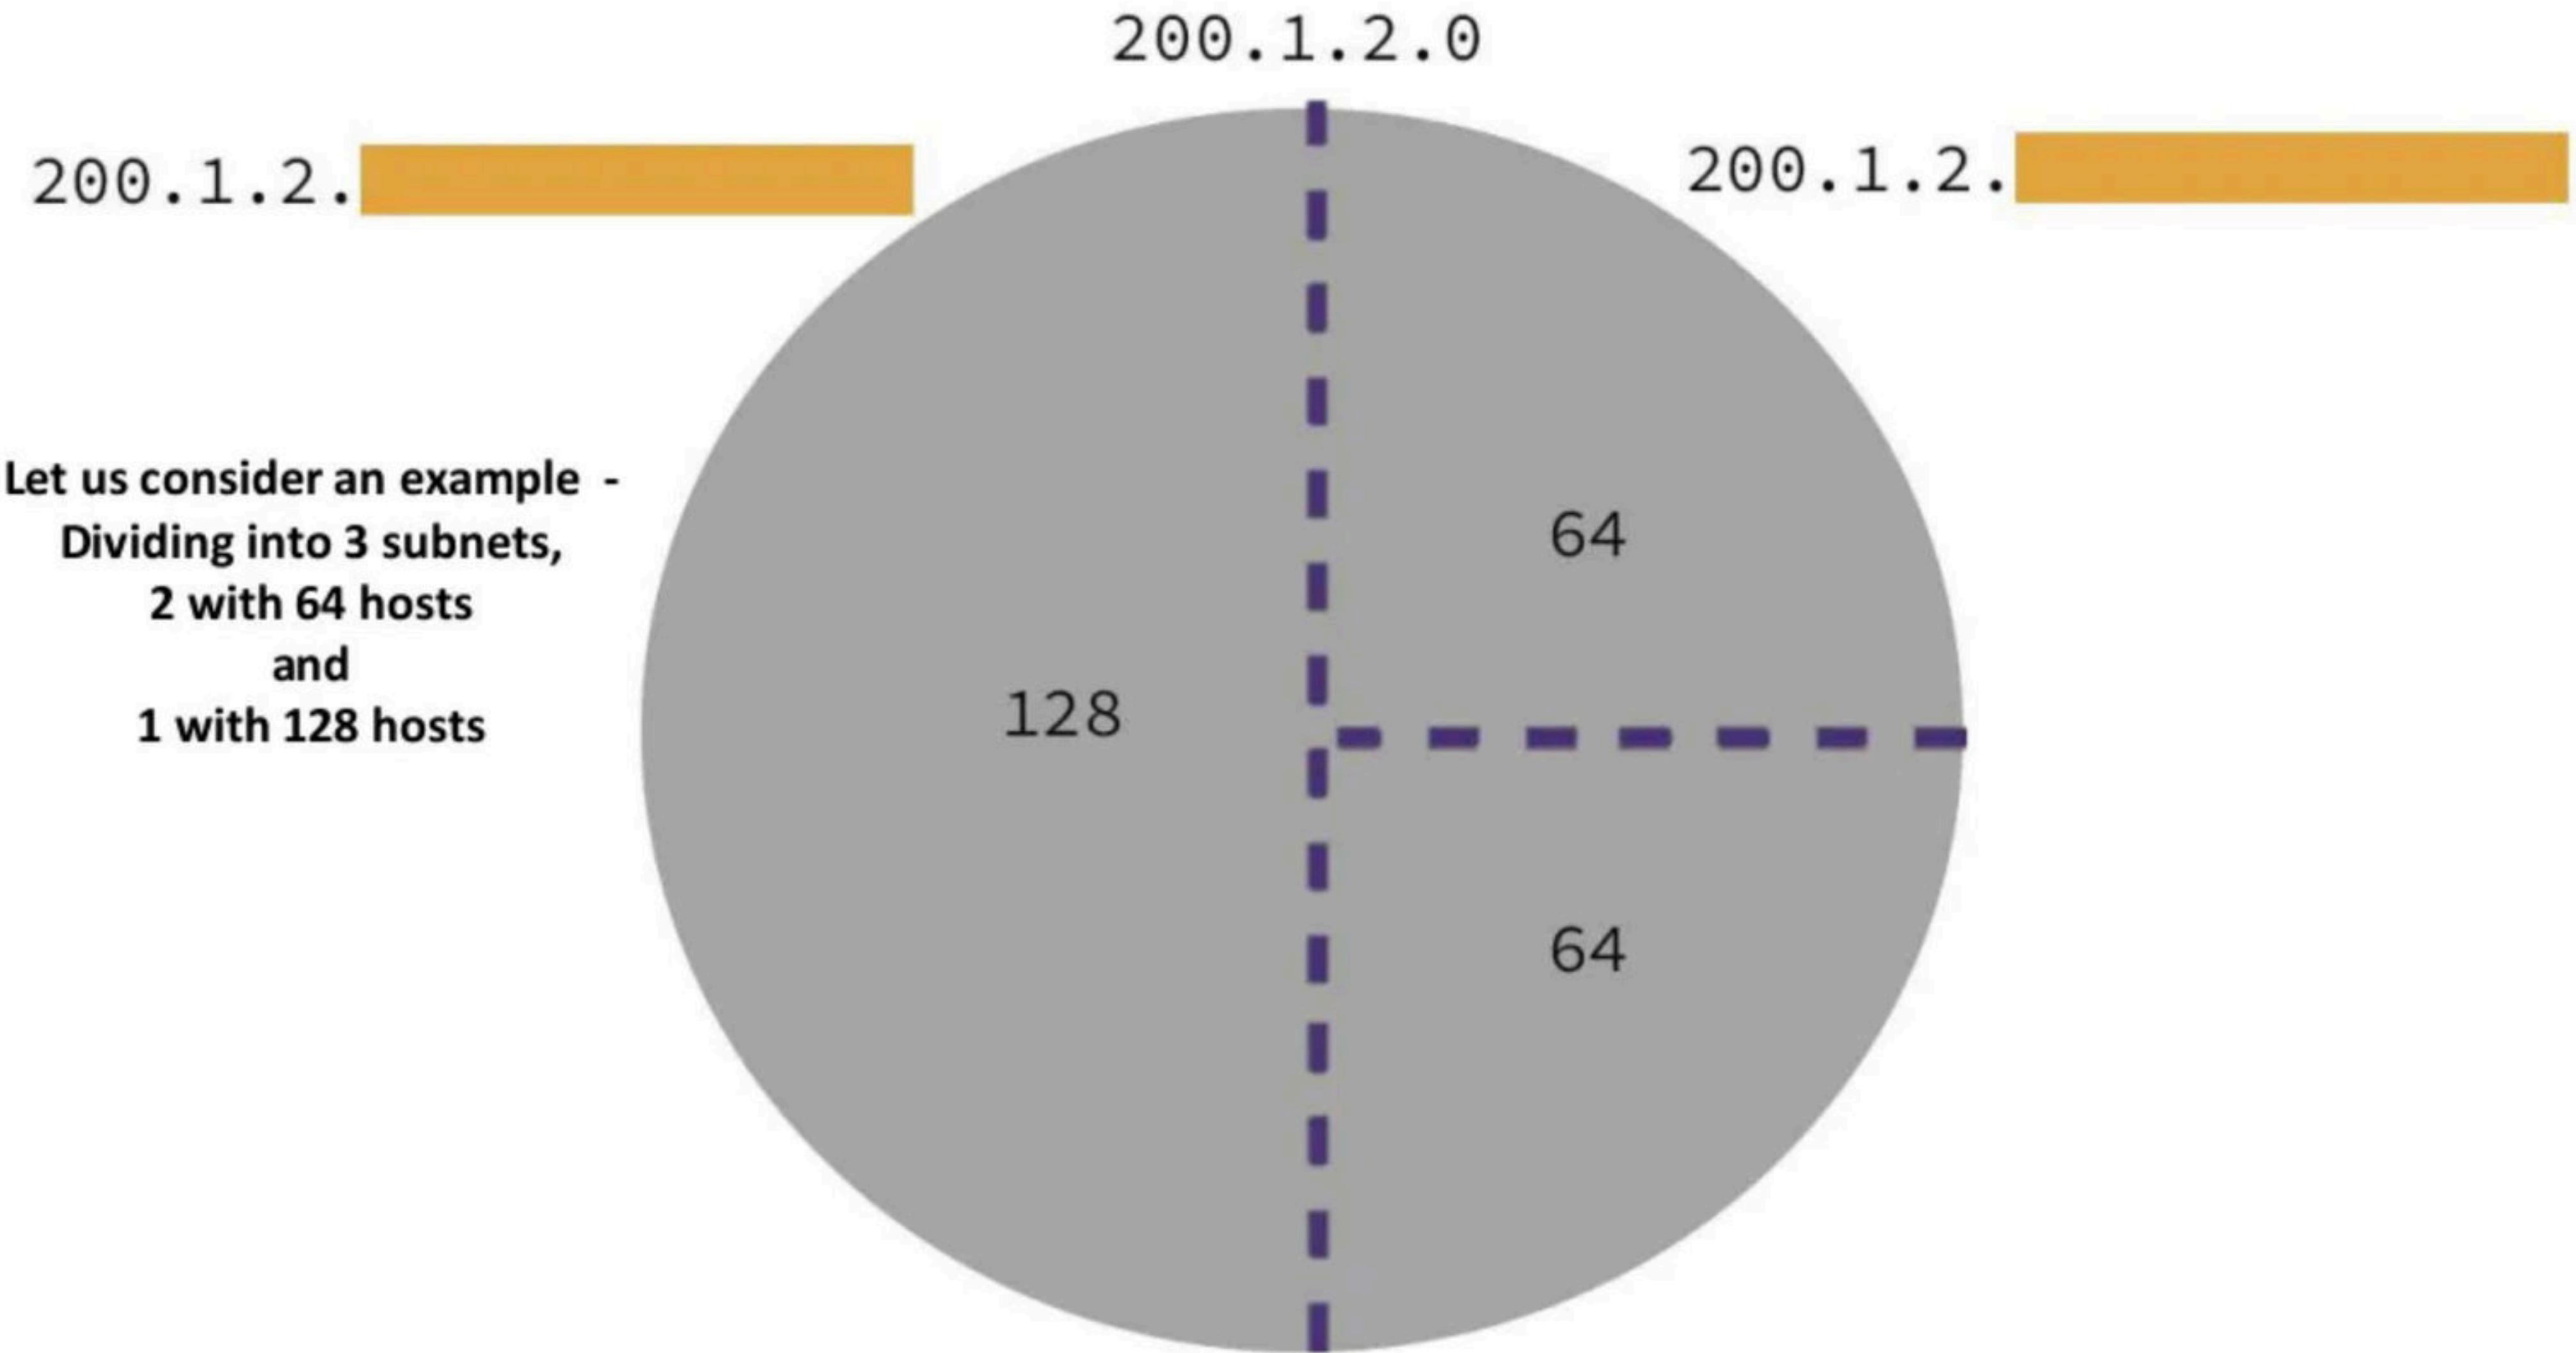

200.1.2.0 ISP 3SN $\rightarrow 2 = \frac{2^2}{2} = 4$

Length of sm ↑

- VLSM
- a) n/w size increases
 - b) n/w size decreases
 - c) I don't care

Let us consider an example -
Dividing into 3 subnets,
2 with 64 hosts
and
1 with 128 hosts

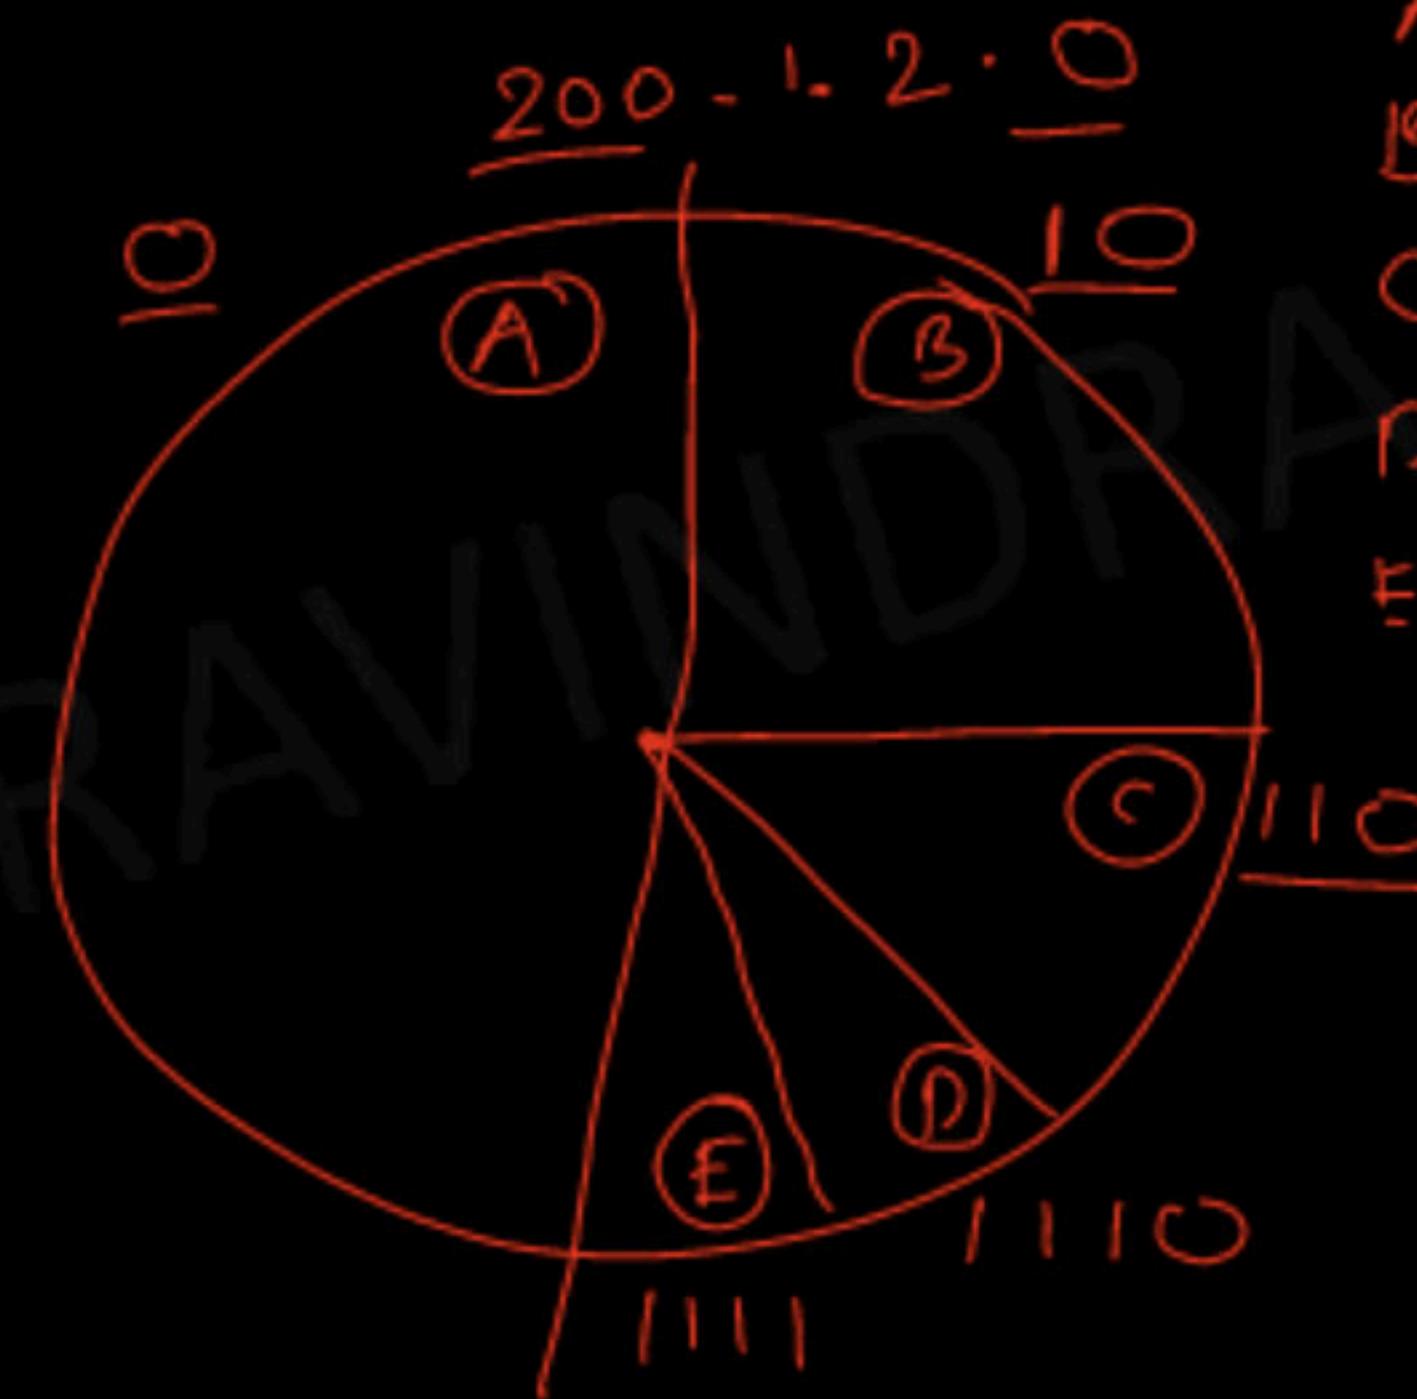

111 1111 11111 \rightarrow 50's

L ↑

$$SM_A = SM_B$$

size of n/w Same

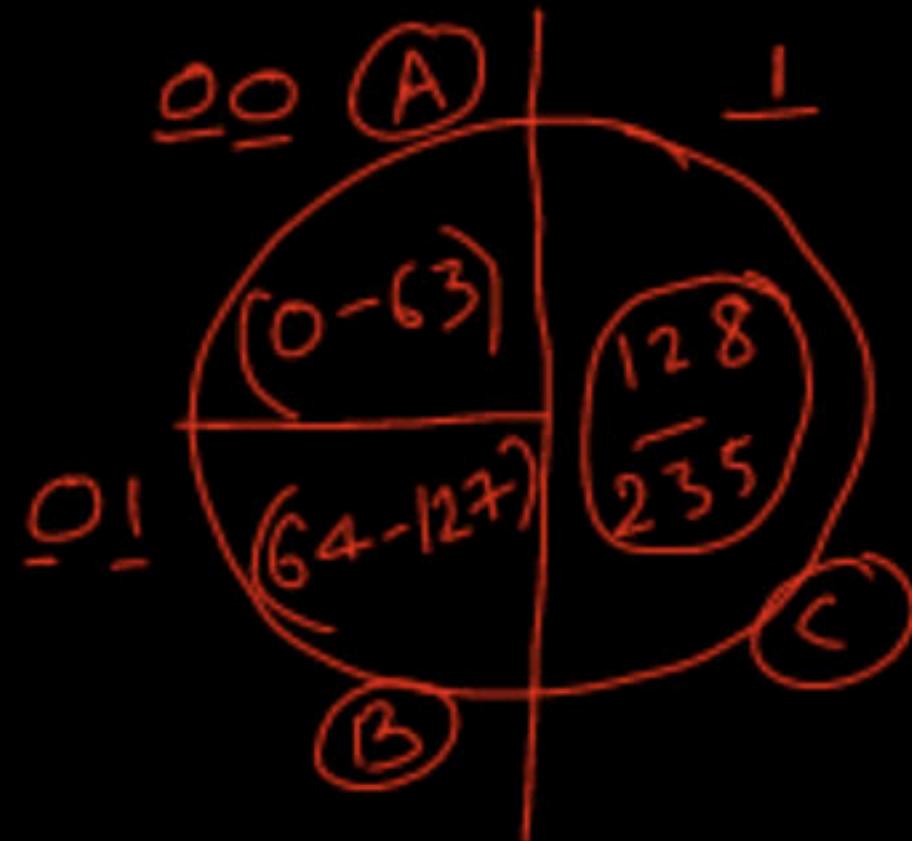

$$A - (0 - 127) - 25 - 2^7$$

$$B - (128 - 191) - 26 - 2^6$$

$$C - (192 - 223) - 27 - 2^5$$

$$D - (224 - 239) - 28 - 2^4$$

$$E - (240 - 255) - 29 - 2^3$$

$\underline{00} \underline{00} \underline{00} \underline{00} \underline{00} \underline{00}$

$\underline{00} \underline{11} \underline{11} \underline{11} \underline{11} \underline{11}$

$\underline{01} \underline{00} \underline{00} \underline{00} \underline{00} \underline{00}$

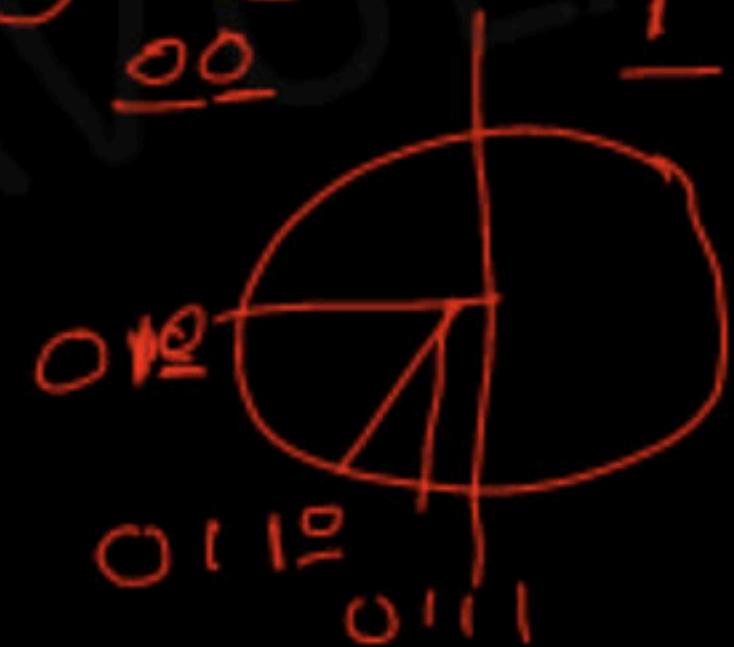

$\underline{01} \underline{11} \underline{11} \underline{11} \underline{11} \underline{11}$

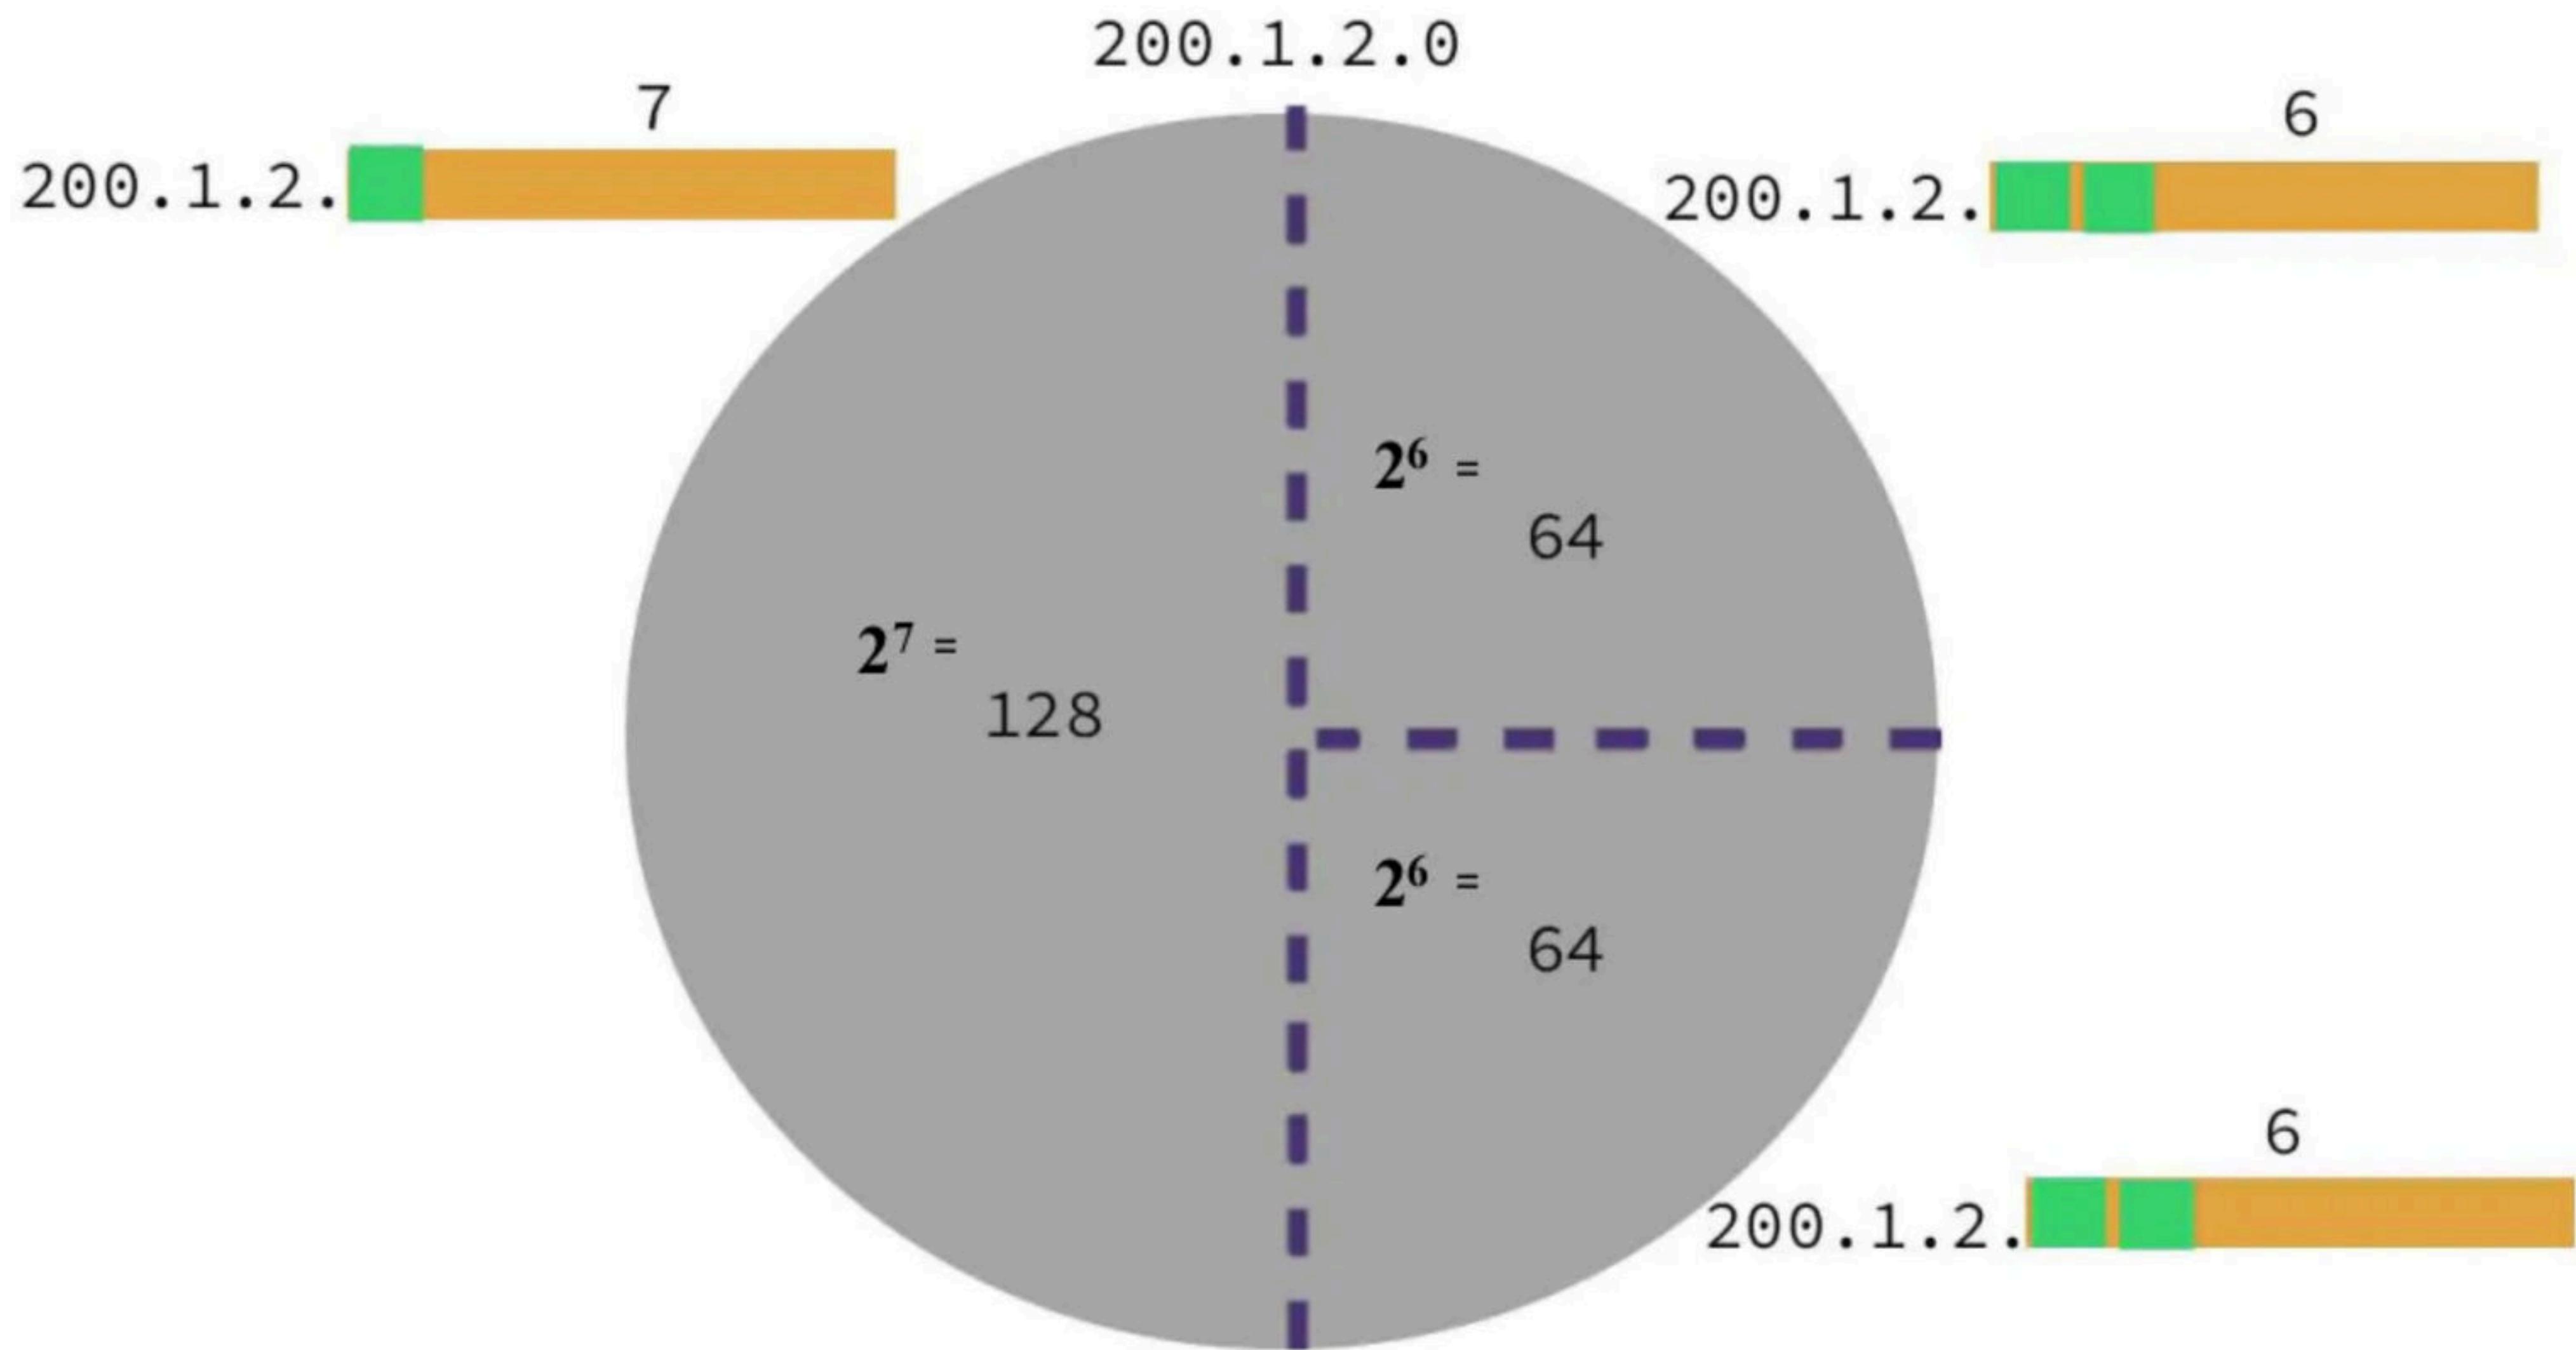

$\underline{10} \underline{00} \underline{00} \underline{00} \underline{00} - 128$

$\underline{11} \underline{11} \underline{11} \underline{11} \underline{11} \underline{11} - 1255$

$A \rightarrow 26$
 $B \rightarrow 25$
 $C \rightarrow 25$

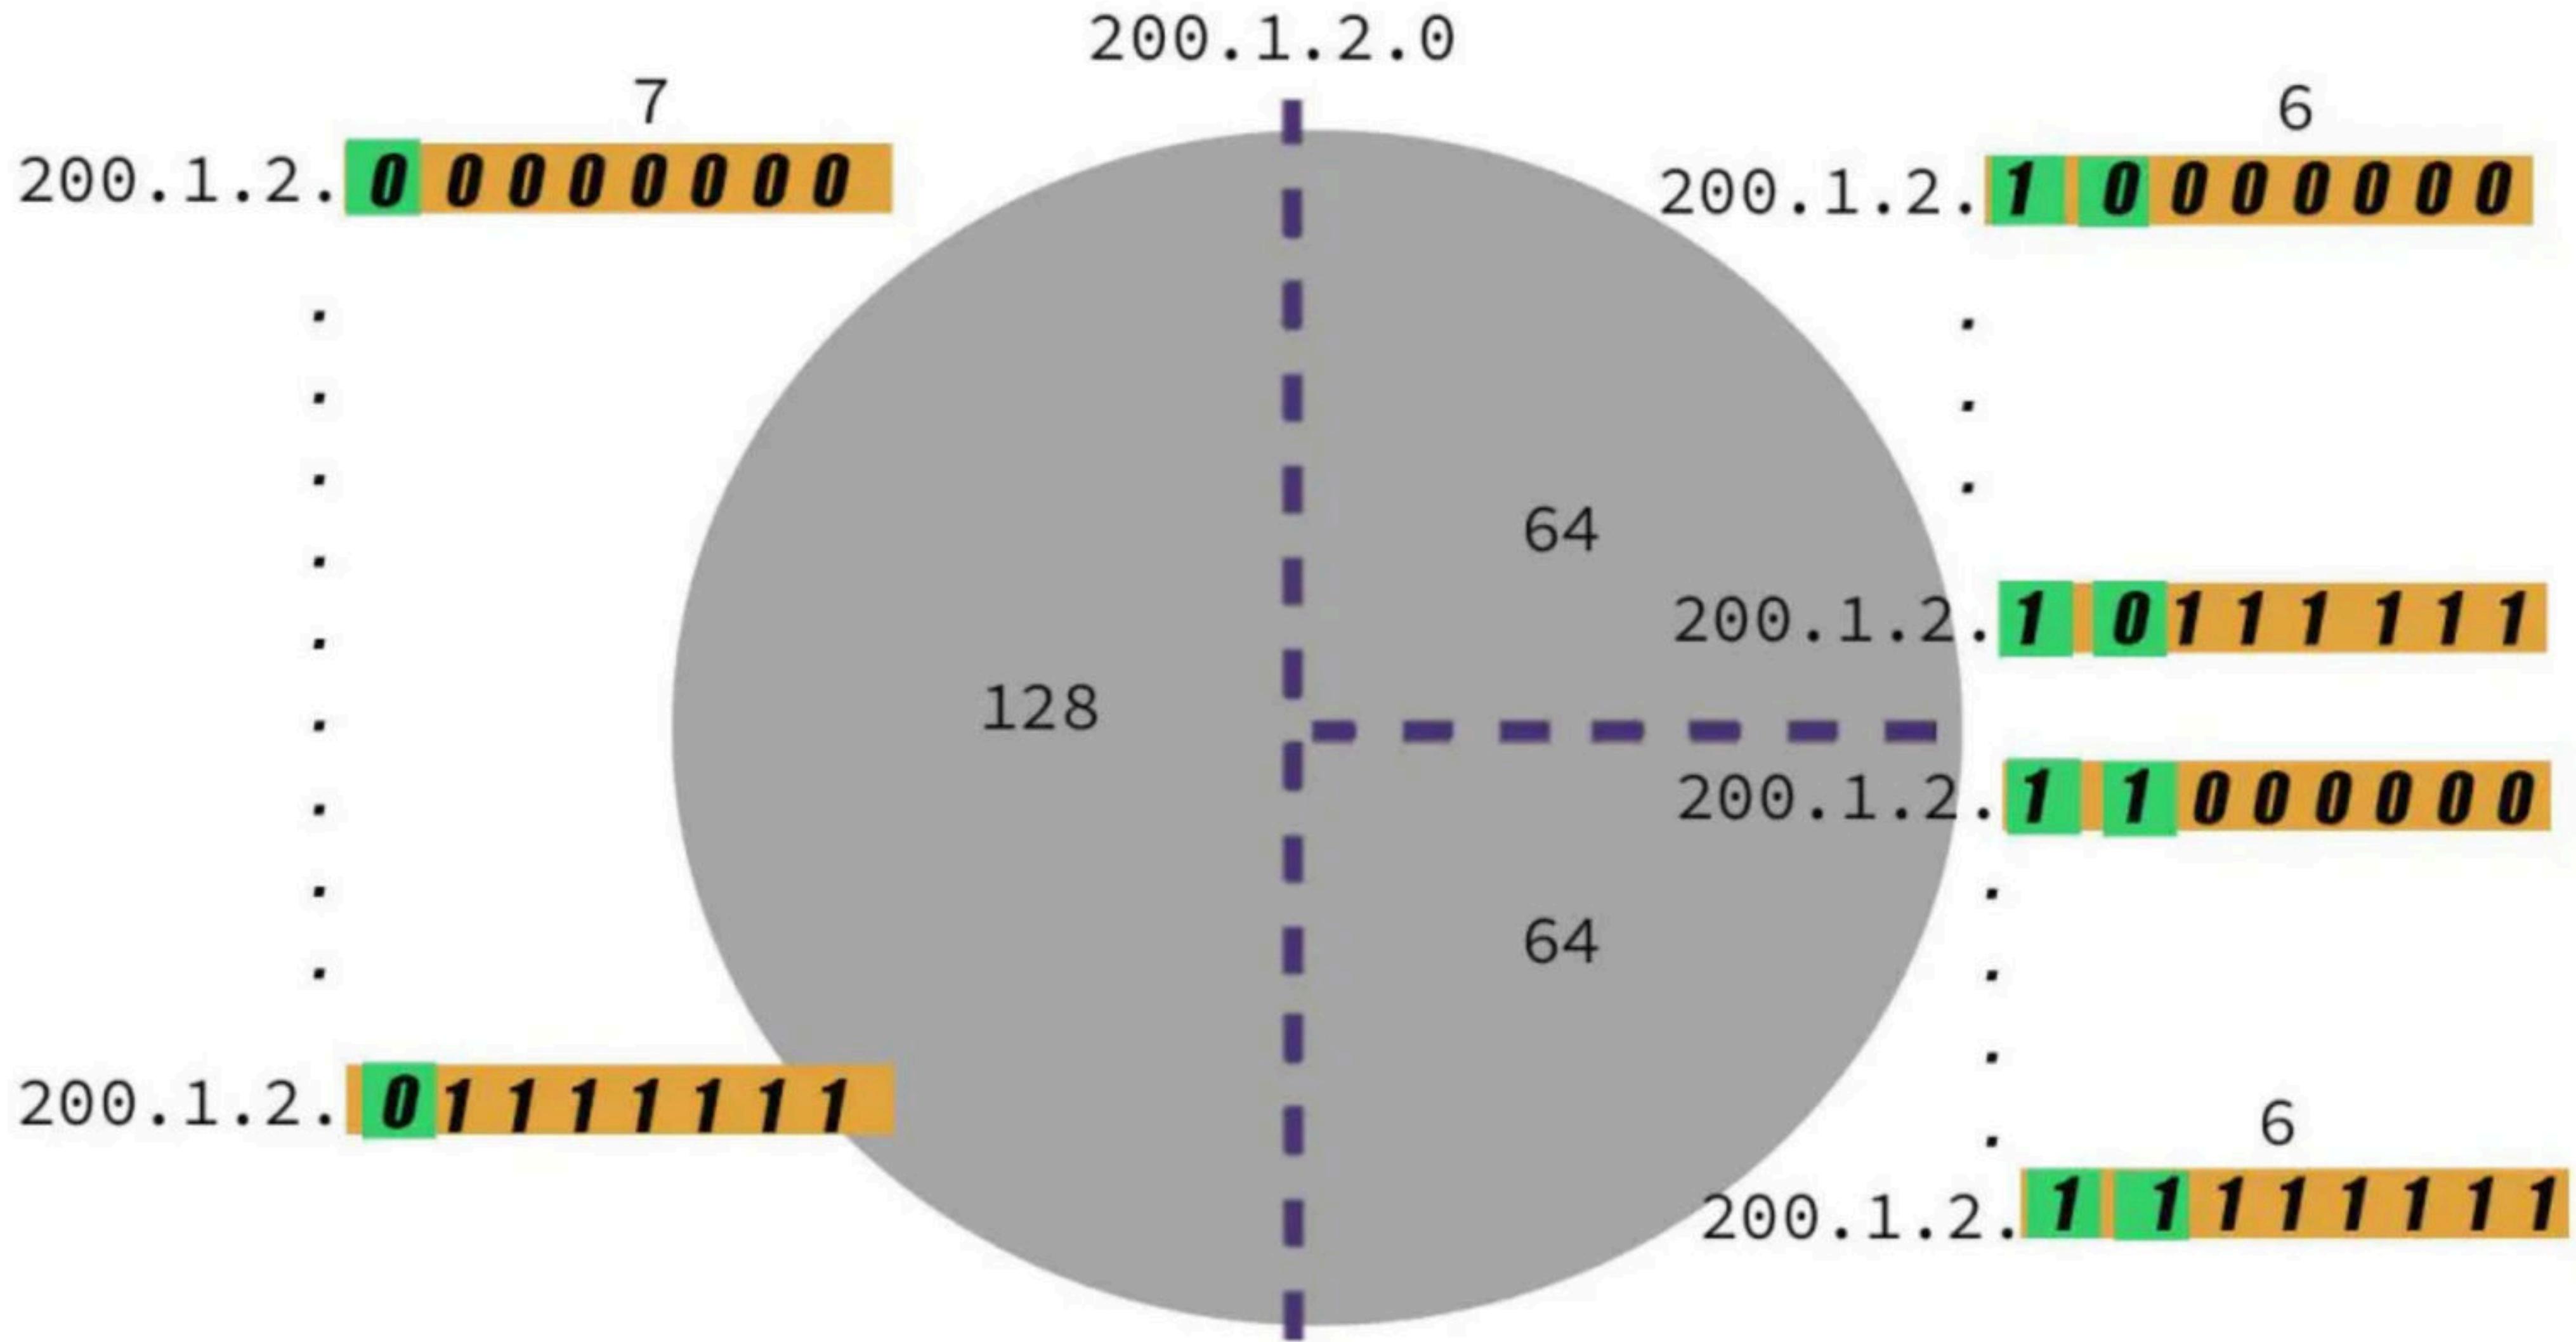

$\wedge - (0-63)$

NOTE:

In order to find out the SID (Subnet id) or No of subnets, we must know either the Class of that network or NID

We can find out the HID even if
The class of the network is not known

For example:

If Subnet mask = 255.255.255.192, And it known to be of Class A then,

We know that,

NID + SID = No of 1's

HID = No of 0's

No of 1's = 26

NID In class A = 8 bits

$8 + SID = 26$

$SID = 18$

$No\ of\ subnets = 2^{18}$

No of 0's = 6

HID = 6

$IP/network = 2^6$

$Hosts/subnet=2^6-2$

QUESTION:

If the subnet mask 255.255.255.128 belongs to class C, find-

1. Number of subnets
2. Number of hosts in each subnet

SOLUTION:

Given subnet mask= 255.255.255.128
= 11111111.11111111.11111111.10000000

Since 25 bits contain the value 1 and 7 bits contain the value 0, so-

- Number of NID bits + Number of Subnet ID bits = 25
- Number of HID bits = 7

Now,

- It is given that subnet mask belongs to class C.
- So, Number of NID bits = 24.

Substituting in the above equation, we get-

Number of Subnet ID bits

$$= 25 - 24$$

$$= 1$$

Number of subnets = $2^1 = 2$

Since number of HID bits = 7, so-

Number of hosts per subnet = $2^7 - 2 = 126$

GATE 2008

If a class B network on the Internet has a subnet mask of 255.255.248.0, what is the maximum number of hosts per subnet?

- (A) 1022
- (B) 1023
- (C) 2046
- (D) 2047

Answer (C)

The binary representation of subnet mask is
11111111.11111111.1111000.00000000.

There are 21 bits set in subnet.

So 11 bits are left for host ids.

Total possible values of host ids is $2^{11} = 2048$.

Out of these 2048 values, 2 addresses are reserved.

The address with all bits as 1 is reserved as broadcast address and address with all host id bits as 0 is used as network address of subnet.

In general, the number of addresses usable for addressing specific hosts in each network is always $2^N - 2$ where N is the number of bits for host id.

Therefore, maximum no of hosts per subnet = $2048 - 2 = 2046$
