

# Python as OOPs Part 1

Course on Data Structure and Algorithms Using Python

# Python Programming

## Python Collections (List and Set)

# Content

- List
- List Indexing and Slicing
- Nested List
- List Methods
- Set
- Set Methods
- Sample Problems

# List

List used to store multiple items in a single variable. It is one of 4 built-in data types in Python used to store collections of data. other three are Set, Tuple, Dictionary. It is defined as:

## Syntax:

*List\_name=[item-1, item-2, item-3, item-4,....., item-n]*

## Example:

*Designation=['Assistant', 'Supervisor', 'Manager', 'Technician']*

# List

List items are ordered, changeable or mutable, and allow duplicate data items.

## Ordered:

```
Age=[20,24,17,26,22,28,32,25,36,31]
```

```
print(Age)
```

$$\text{Age}[2] = 35$$

## Mutable:

```
0 1 2  
Age=[20,24,17,26,22,28,32,25,36,31] 35
```

```
Age.append(45)
```

```
print(Age) →
```

## Duplicate:

```
Age=[20,24,17,26,22,28,32,25,36,31,32,42]
```

```
print(Age)
```

# List Indexing & Slicing

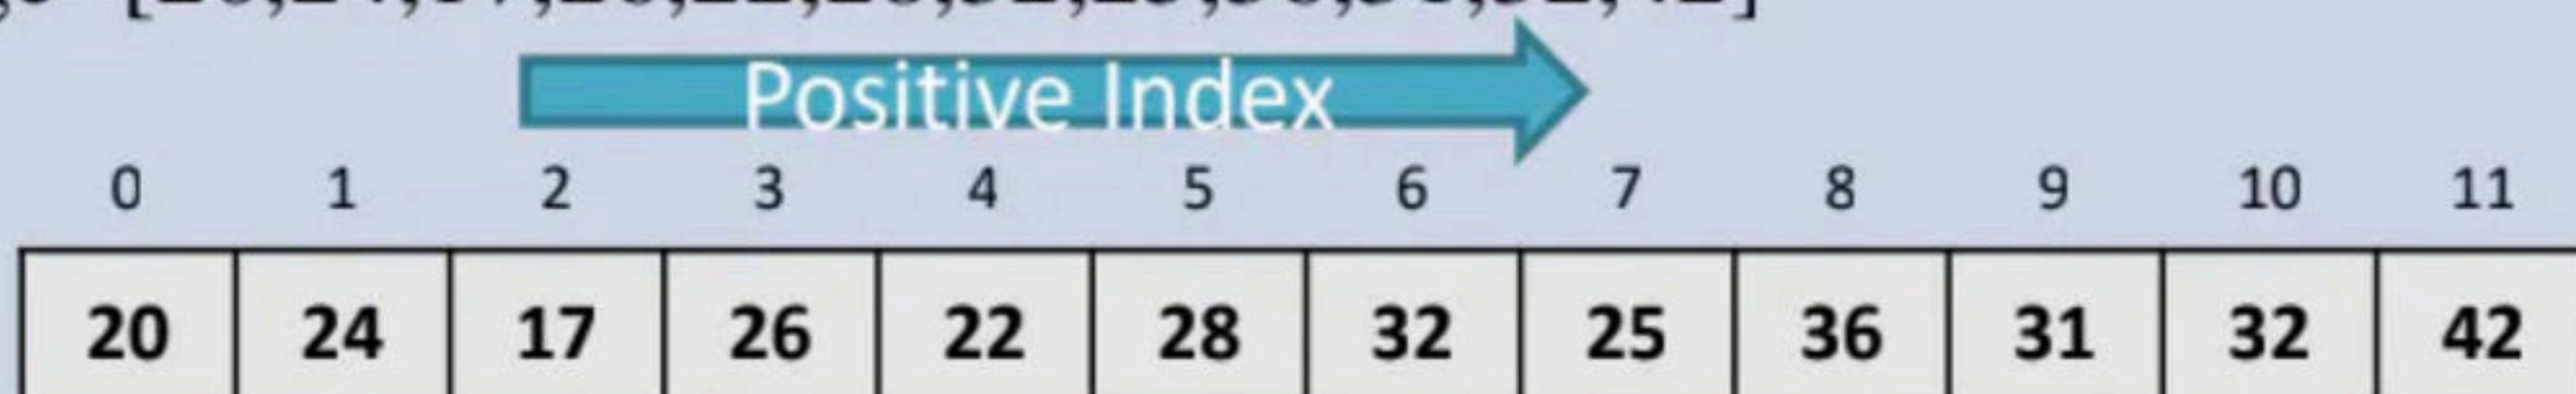

- Like a string, we can also define indexes to data items of list.
- Python support two types of indexing:
  - Positive Indexing
  - Negative Indexing

# Positive Indexing

- It begins with zero and ends with list length-1 from left hand side.

## List Positive Indexing Examples:

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

## Access List Data Items via Index:

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

print(Age[1])

# Let's Try...

## Guess Output?

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

print(Age[2\*3])

print(Age[10//3])

print(Age[10%3])

print(Age[2\*\*2])

print(Age[8>>2])

print(Age[2&4])

print(Age[6^3])

# Negative Indexing

- It begins with -1 and ends with list length in negative from right hand

## String Negative Indexing Examples:

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

-12	-11	-10	-9	-8	-7	-6	-5	-4	-3	-2	-1
20	24	17	26	22	28	32	25	36	31	32	42

## Access String Character via Negative Index:

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

-12	-11	-10	-9	-8	-7	-6	-5	-4	-3	-2	-1
20	24	17	26	22	28	32	25	36	31	32	42

print(Age[-8])

# Let's Try...

## Guess Output?

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

print(Age[-5])

print(Age[-6-2])

print(Age[-9+11])

print(Age[14-10])

print(Age[-8-3])

print(Age[-4+4])

print(Age[-12+6])

# List Slicing

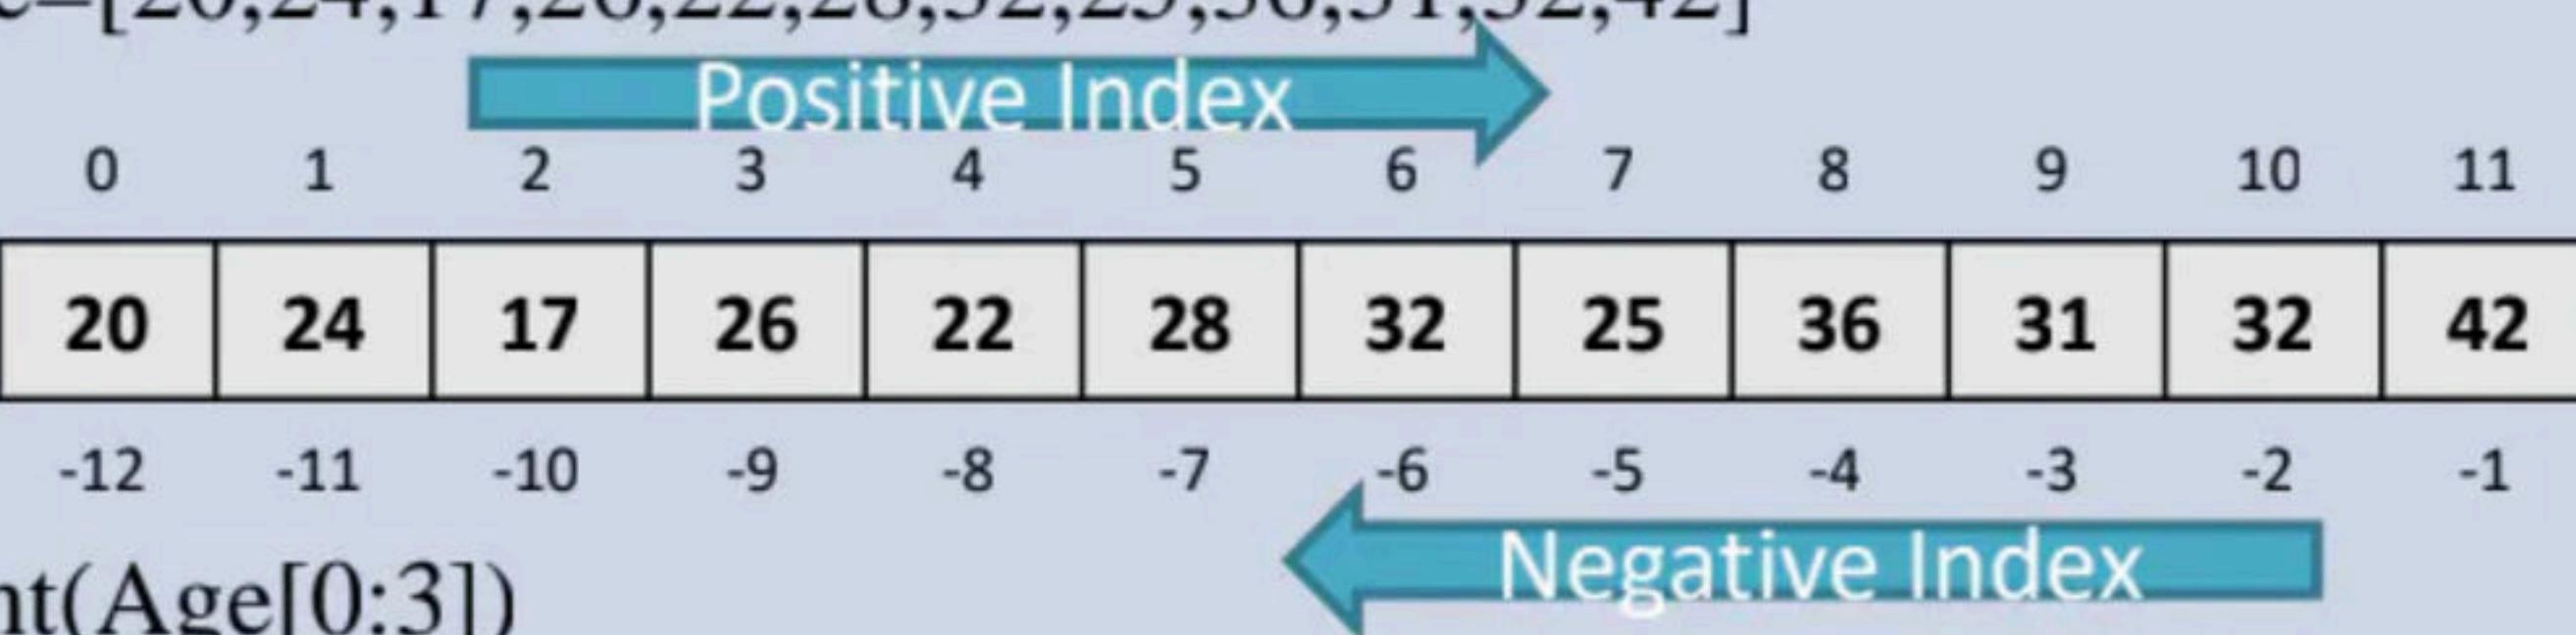

- It is way to access set of data items from the given list. It is denoted as:

*list\_name[startindex : endindex]*

- It slices list from startindex and end with endindex-1 i.e. it excludes endindex value. Slice index may be positive or negative range.

## String Slicing Examples:

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

print(Age[0:3])

print(Age[-11:-7])

# Let's Try...

## Guess Output?

Age=[20,24,17,26,22,28,32,25,36,31,32,42]

print(Age[1+1:4+0])

print(Age[0:2\*\*3])

print(Age[-12:-7+3])

print(Age[-1:-7])

print(Age[:10])

print(Age[:-6])

print(Age[2:-2])

print(Age[-8:14])

# Change List Data Items

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
EmpName[1]='Romy'
```

```
print(EmpName)
```

```
EmpName[0:2]=['Romy','Jack']
```

```
print(EmpName)
```

# Insert New Data Items in List

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
EmpName.insert(0,'Jam')
```

```
print(EmpName)
```

# Append New Data Items at End of the List

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
EmpName.append('Jam')
```

```
print(EmpName)
```

# Remove Specified Data Items from the List

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
EmpName.remove('Bob')
```

```
print(EmpName)
```

```
EmpName.pop(0)
```

```
print(EmpName)
```

```
del EmpName[1]
```

```
print(EmpName)
```

```
del EmpName
```

```
print(EmpName)
```

```
EmpName.clear()
```

```
print(EmpName)
```

# Sort

- `sort()` is a method of `list` class and can only be used with lists.
- **Syntax:** `List_name.sort(key, reverse=False)`  
**Parameters:**  
`key`: A function that serves as a key for the sort comparison.  
`reverse`: If true, the list is sorted in descending order.  
**Return type:** None

# Sort List Data Items

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
EmpName.Sort() # Ascending Order
```

```
print(EmpName)
```

```
EmpName.Sort(reverse=True) # Descending Order
```

```
print(EmpName)
```

```
def myFunc(e):  
    return len(e)
```

```
cars = ['Tata', 'creta', 'BMW', 'Ford']
```

```
cars.sort(key=myFunc)  
print(cars)
```

```
def myFunc(e):  
    return len(e)
```

```
cars = ['Tata', 'creta', 'BMW', 'Ford']
```

```
cars.sort(key=myFunc, reverse = True)  
print(cars)
```

# Copy Lists

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
Name=EmpName.copy() # Copy method
```

```
print(Name)
```

```
Name=list(EmpName) # List Method
```

```
print(Name)
```

# Join Lists

## Example:

```
EmpName=["Jhon","Bob","Marry","Cherry"]
```

```
Age=[24,22,28,19]
```

```
NameAge=EmpName+Age # + Operator
```

```
print(NameAge)
```

```
for x in Age:
```

```
    EmpName.append(x)
```

```
print(EmpName)
```

```
EmpName.extend(Age) # Extend() Method
```

```
print(EmpName)
```

# List Comprehension

## Example:

```
EmpName=['Jhon','Bob','Marry','Cherry']
```

```
newlist = [x for x in EmpName ]
```

```
print(EmpName)
```

# Nested Lists

Nested Lists are used to store multiple sublists in a single list..\\

It is defined as:

A diagram illustrating a nested list structure. It shows a main list [ ] containing three sublists: [ ], [ ], and [ ]. Red arrows and numbers indicate the nesting level: a double arrow labeled '2' points to the innermost list [ ]; a single arrow labeled '1' points to the middle list [ ]; and another single arrow labeled '1' points to the outermost list [ ].

## Syntax:

*List\_name=[[item-1, item-2], [item-3, item-4],[....., item-n]]*

## Example:

A diagram illustrating a nested list named 'Student'. The list contains three sublists: ['Allen', 'Bob', 'Jhon', 'Jerry'], [21, 23, 19, 24], and [7.5, 8.0, 8.5, 7.6]. Red annotations show indices: '0 1 2 3' above the first sublist, '0 1 2 3' above the second, and '0 1 2 3' above the third. Below the first sublist, '3' is written with a minus sign. Below the second, '2' is written with a minus sign. Below the third, '1' is written with a minus sign.

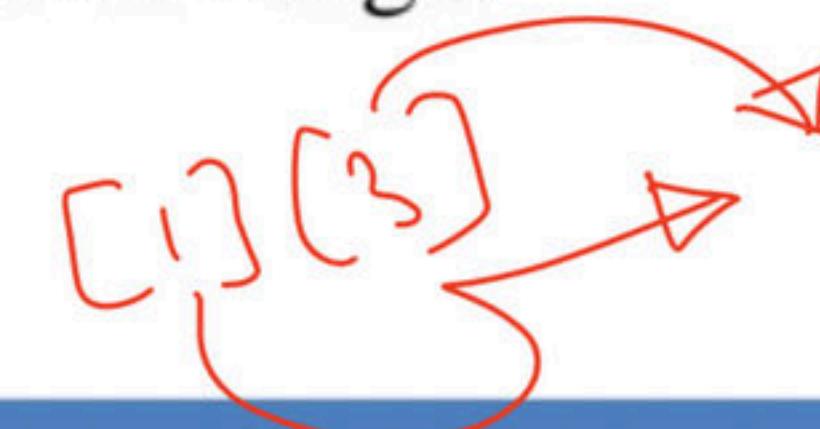

```
Student=[[‘Allen’, ‘Bob’, ‘Jhon’, ‘Jerry’], [21,23,19,24], [7.5,8.0,8.5,7.6]]
```

# Nested Lists Indexing & Slicing

- It is way to access set of data items from the given list. It is denoted as:

*list\_name[[startindex : endindex],[],[]]*

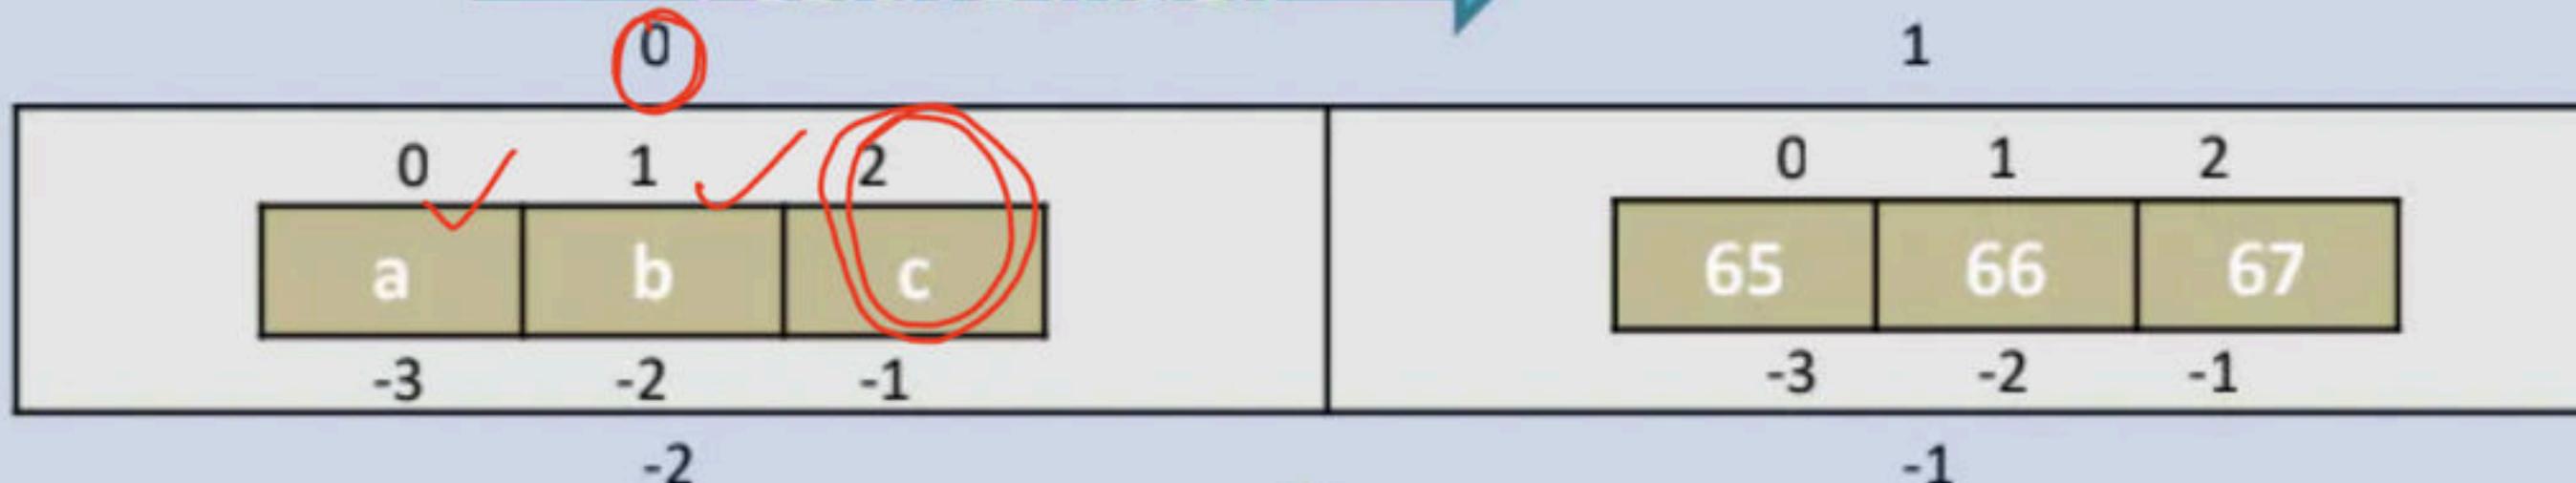

- It slices list from startindex and end with endindex-1 i.e. it excludes endindex value. Slice index may be positive or negative range.

## String Slicing Examples:

```
nlist=[[‘a’,’b’,’c’],[65,66,67]]
```

Positive Index →

Negative Index ←

```
print(nlist[0][2])
```

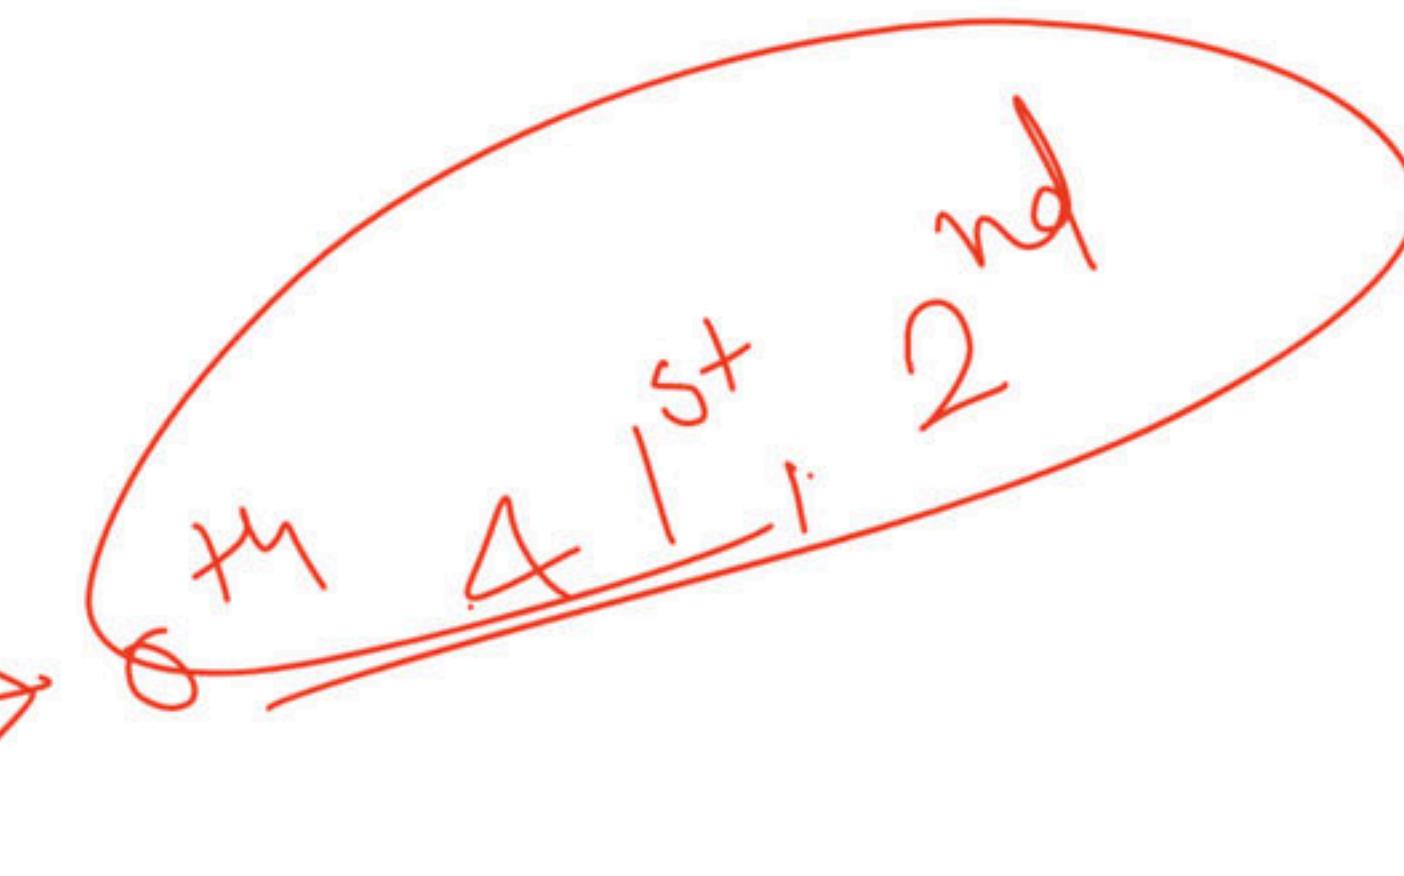

EmpName=[["Jhon","Bob","Marry","Cherry"],[1,2,3,4],[1.1,1.2,1.3]]

① print(EmpName[0])

② print(EmpName[1])

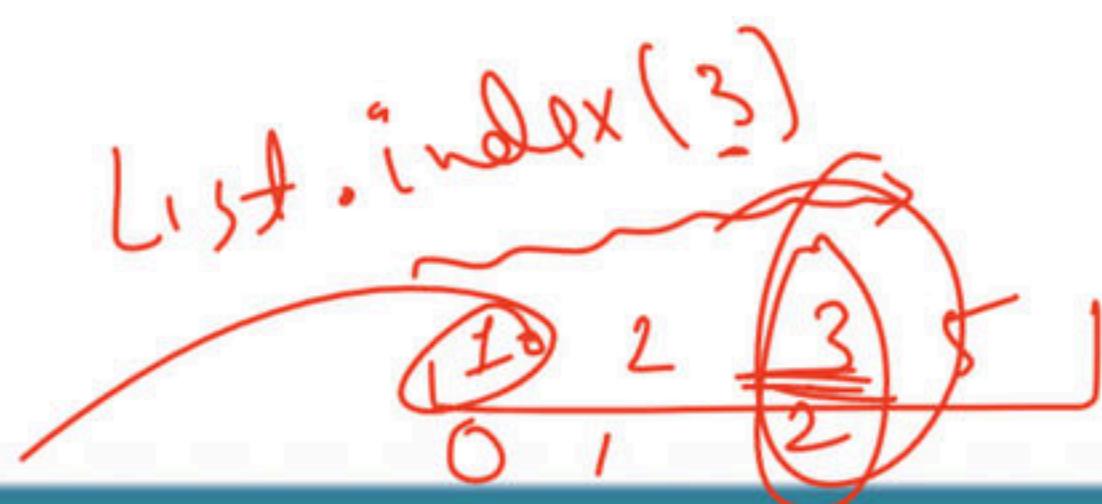

③ print(EmpName[0:3])

0 to 2

# List Methods

In python, several built-in methods are available.

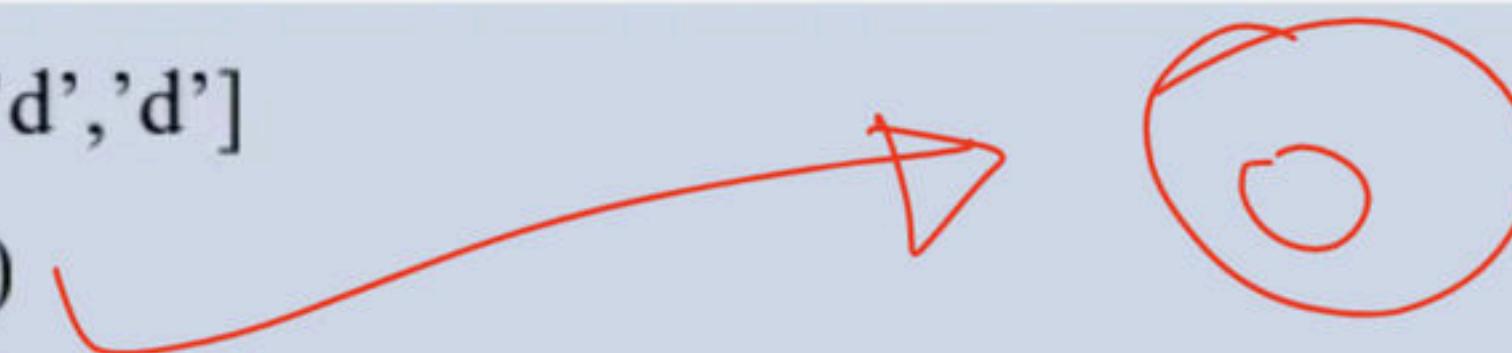

Method Name	Description
<u>append()</u>	Adds an element at the end of the list
<u>clear()</u>	Removes all the elements from the list
<u>copy()</u>	Returns a copy of the list
<u>count()</u>	Returns the number of elements with the specified value
<u>extend()</u>	Add the elements of a list (or any iterable), to the end of the current list
<u>index()</u>	Returns the index of the first element with the specified value
<u>insert()</u>	Adds an element at the specified position
<u>pop()</u>	Removes the element at the specified position
<u>remove(3)</u>	Removes the item with the specified value
<u>reverse()</u>	Reverses the order of the list
<u>sort()</u>	Sorts the list

# List Methods

## count( ):

```
Alpha=['a','b','a','c','d','d']
```

```
print(Alpha.count('e'))
```

## index( ):

```
Alpha=[0'a',1'b',2'a',3'c',4'd',5'd']
```

```
print(Alpha.index('a'))
```

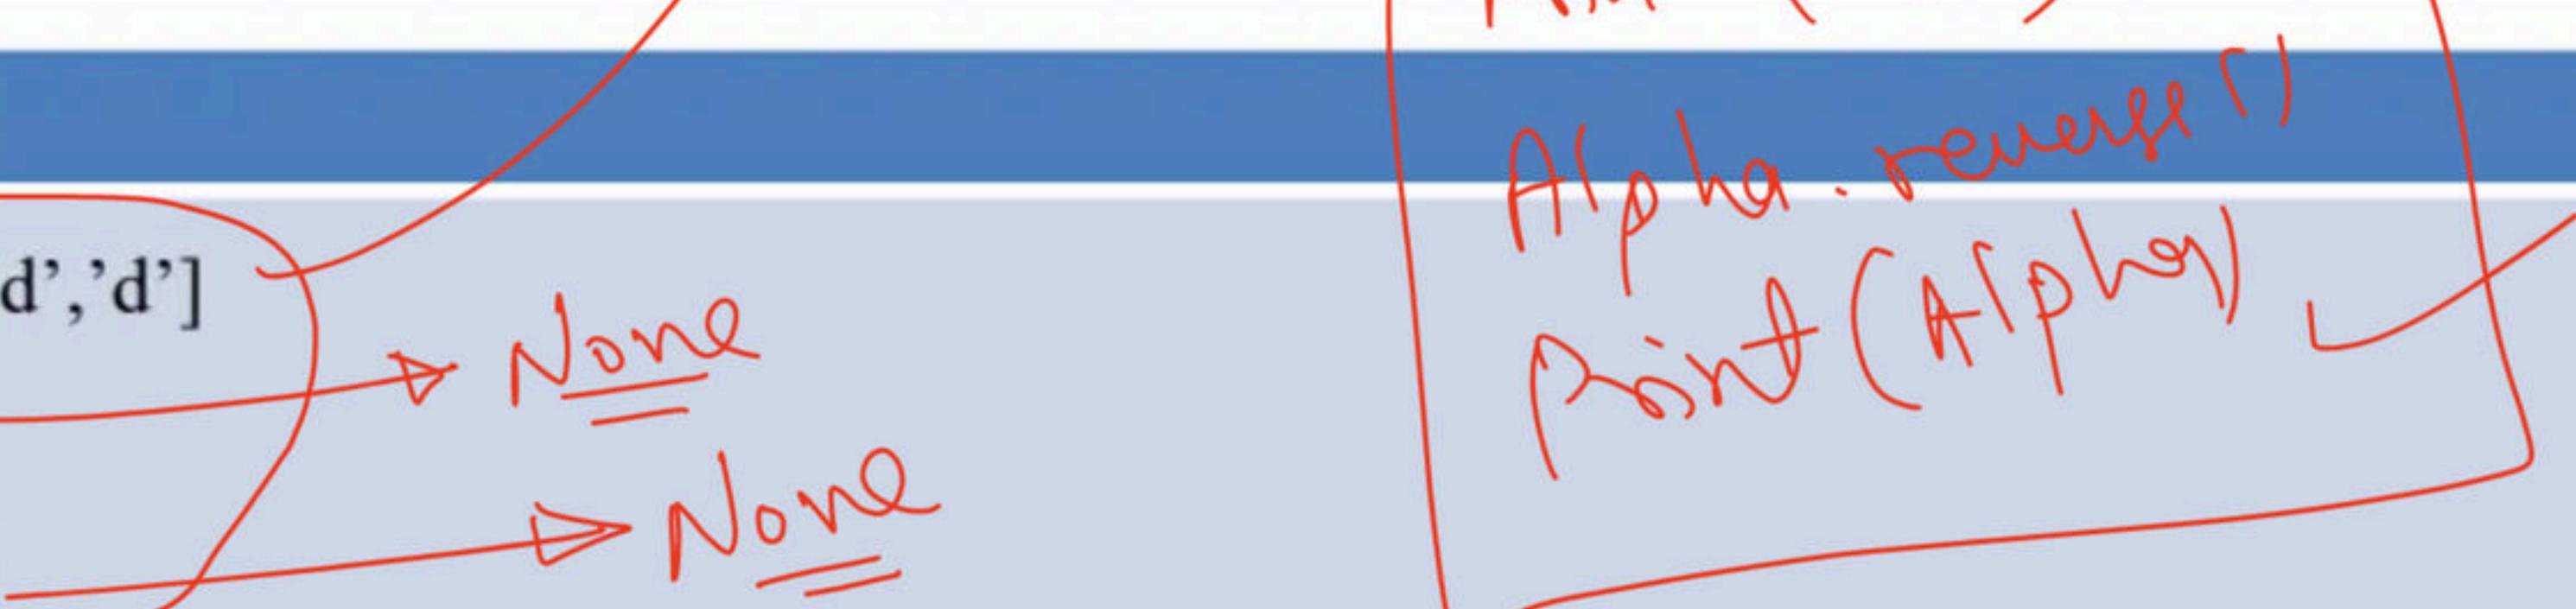

## sort & reverse( ):

```
Alpha=['a','b','a','c','d','d']
```

```
print(Alpha.sort())
```

```
print(Alpha.reverse())
```

①  
Alpha.sort()  
print(Alpha)

Alpha.reverse()  
print(Alpha)

# Set

Set is also used to store multiple items in a single variable. It is defined as:

## Syntax:

*Set\_name={item-1, item-2, item-3, item-4,....., item-n}*

## Example:

*Designation={‘Assistant’, ‘Supervisor’, ‘Manager’, ‘Technician’}*

# Set

Set items are unordered, unchangeable, and do not allow duplicate values.

## Unordered:

Age={20,24,17,26,22,28,32,25,36,31}

print(Age)

{ 31, 36, 25 }

## Immutable or Unchangeable:

Age={20,24,17,26,22,28,32,25,36,31}

Age[2]=35

print(Age)

Type error  
Age[2]=35

## Duplicate Not Allowed:

Age={20,24,17,26,22,28,32,25,36,31,32,42}

print(Age)

IP 3

# Add Set Items

## Example:

```
EmpName={'Jhon','Bob','Marry','Cherry'}
```

```
EmpName.add('Jam')
```

```
print(EmpName)
```

```
Age={21,24,26,28}
```

```
EmpName.update(Age)
```

```
print(EmpName)
```

{Cherry, Marry, Bob, Jhon, Jam}

in my order.

# Remove Set Items

## Example:

```
EmpName={'Jhon','Bob','Marry','Cherry'}
```

```
EmpName.remove('Bob')
```

```
print(EmpName)
```

#remove() method that cause errors if items not found

{'Jhon', 'Marry', 'Cherry'}

```
EmpName.discard('Jam')
```

```
print(EmpName)
```

#discard() method does not cause errors if items not found

\* print(EmpName.pop())

#pop() method remove random element from the set

```
print(EmpName.clear())
```

# clear() method remove all elements from the set

```
print(EmpName)
```

# del keyword will delete set automatically

# Join Sets

## Example:

```
EmpName={'Jhon','Bob','Marry','Cherry'}
```

```
print(EmpName)
```

```
Age={21,24,26,28}
```

```
print(Age)
```

```
EmpAge=EmpName.union(Age)
```

```
print(EmpAge)
```

# Keep Duplicates

## Example:

A={12,4,5,18,25,16,30}

B={25,12,2,18}

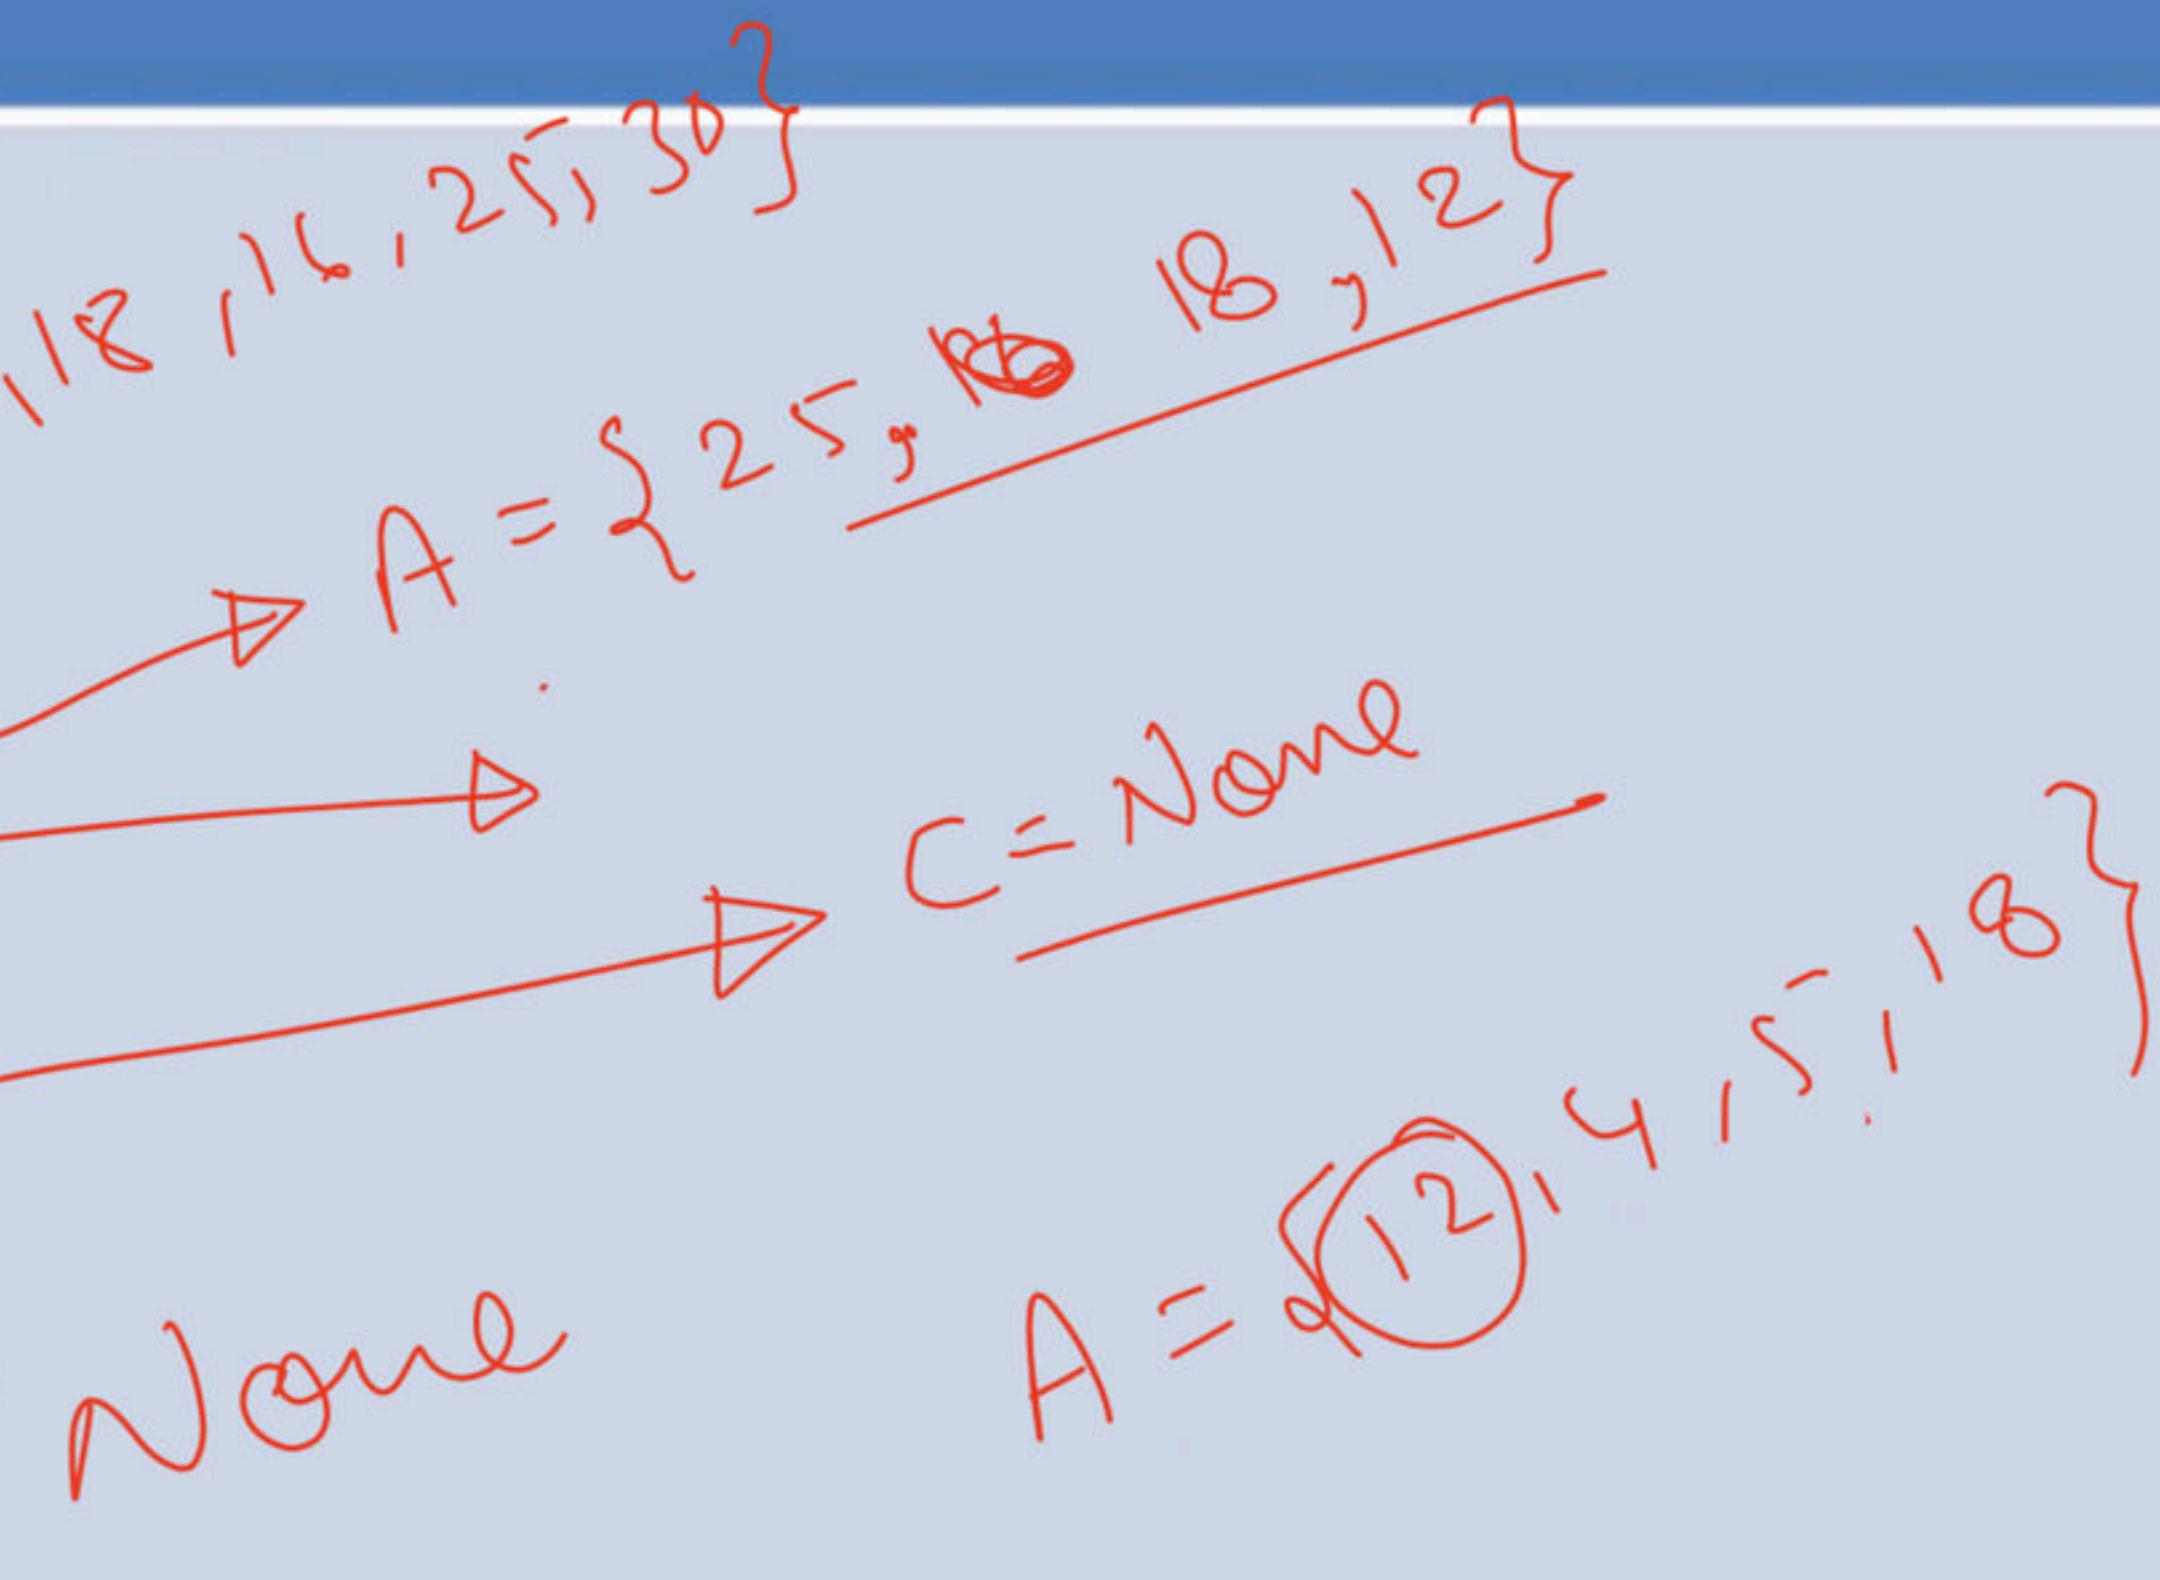

print(A)

A.intersection\_update(B)

print(A)

C=A.intersection\_update(B)

print( C )

# Keep All Except Duplicates

**Example:**

$A = \{12, 4, 5, 18, 25, 16, 30\}$

$B = \{25, 12, 2, 18\}$

`print(A)`

`A.symmetric_difference_update(B)`

`print(A)`

$C = A.symmetric\_difference(B)$

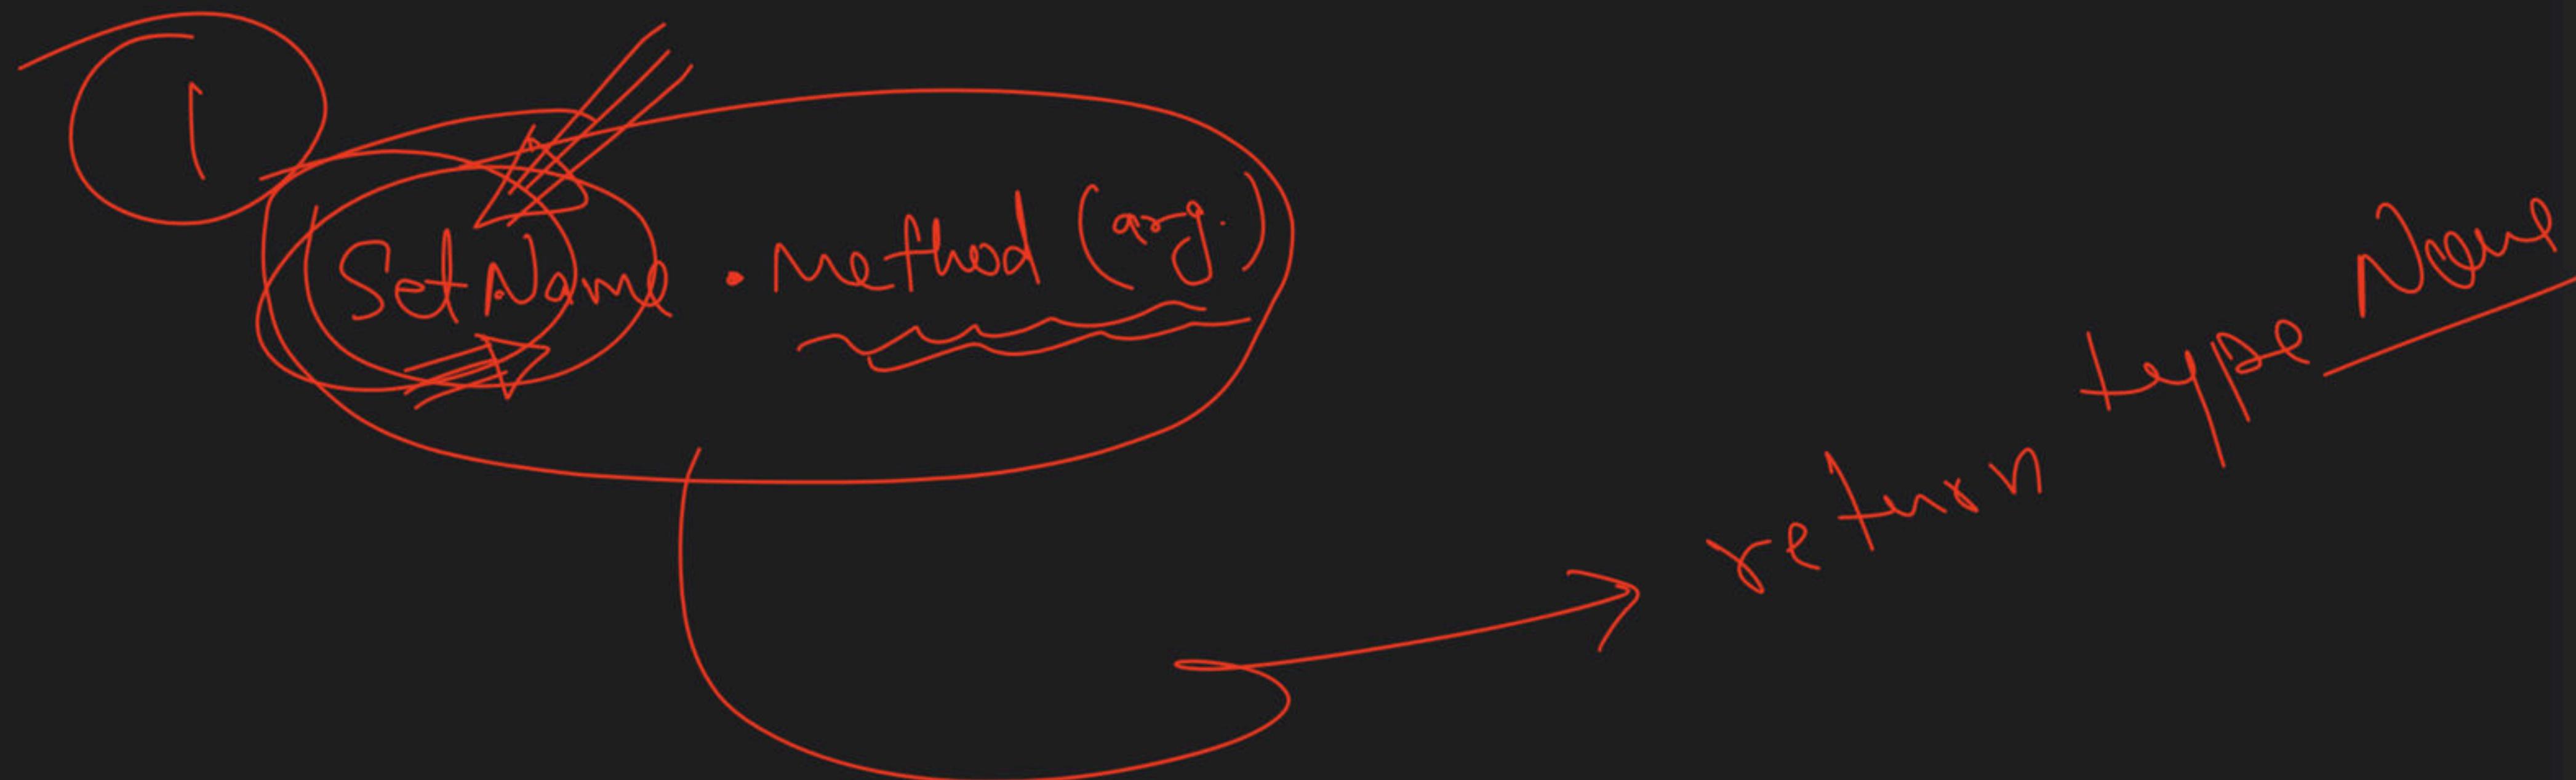

`print(C)`

- ① Union →
- ② intersection →
- ③ difference →
- ④ Symmetric difference

$A \cap B$  → None

$A \cup B$  →

2  $B \cdot \text{sy\_d\_of } A$

$$A - B \Rightarrow \{ \text{ } \}$$

$$B - A \Rightarrow \{ \text{ } \}$$

$$A - B \neq B - A$$

$$A = \{ 1, 2, 3, 4 \}$$

$$B = \{ 3, 4, 5, 6 \}$$

$$A - B = \{ 1, 2 \}$$

$$B - A = \{ 5, 6 \}$$

Symmetric difference  $\Rightarrow \{1, 2, 3, 4\} \Delta \{3, 4, 5, 6\}$

$A = \{1, 2, 3, 4\} \Rightarrow \{1, 2, 3, 4\}$

$B = \{3, 4, 5, 6\}$

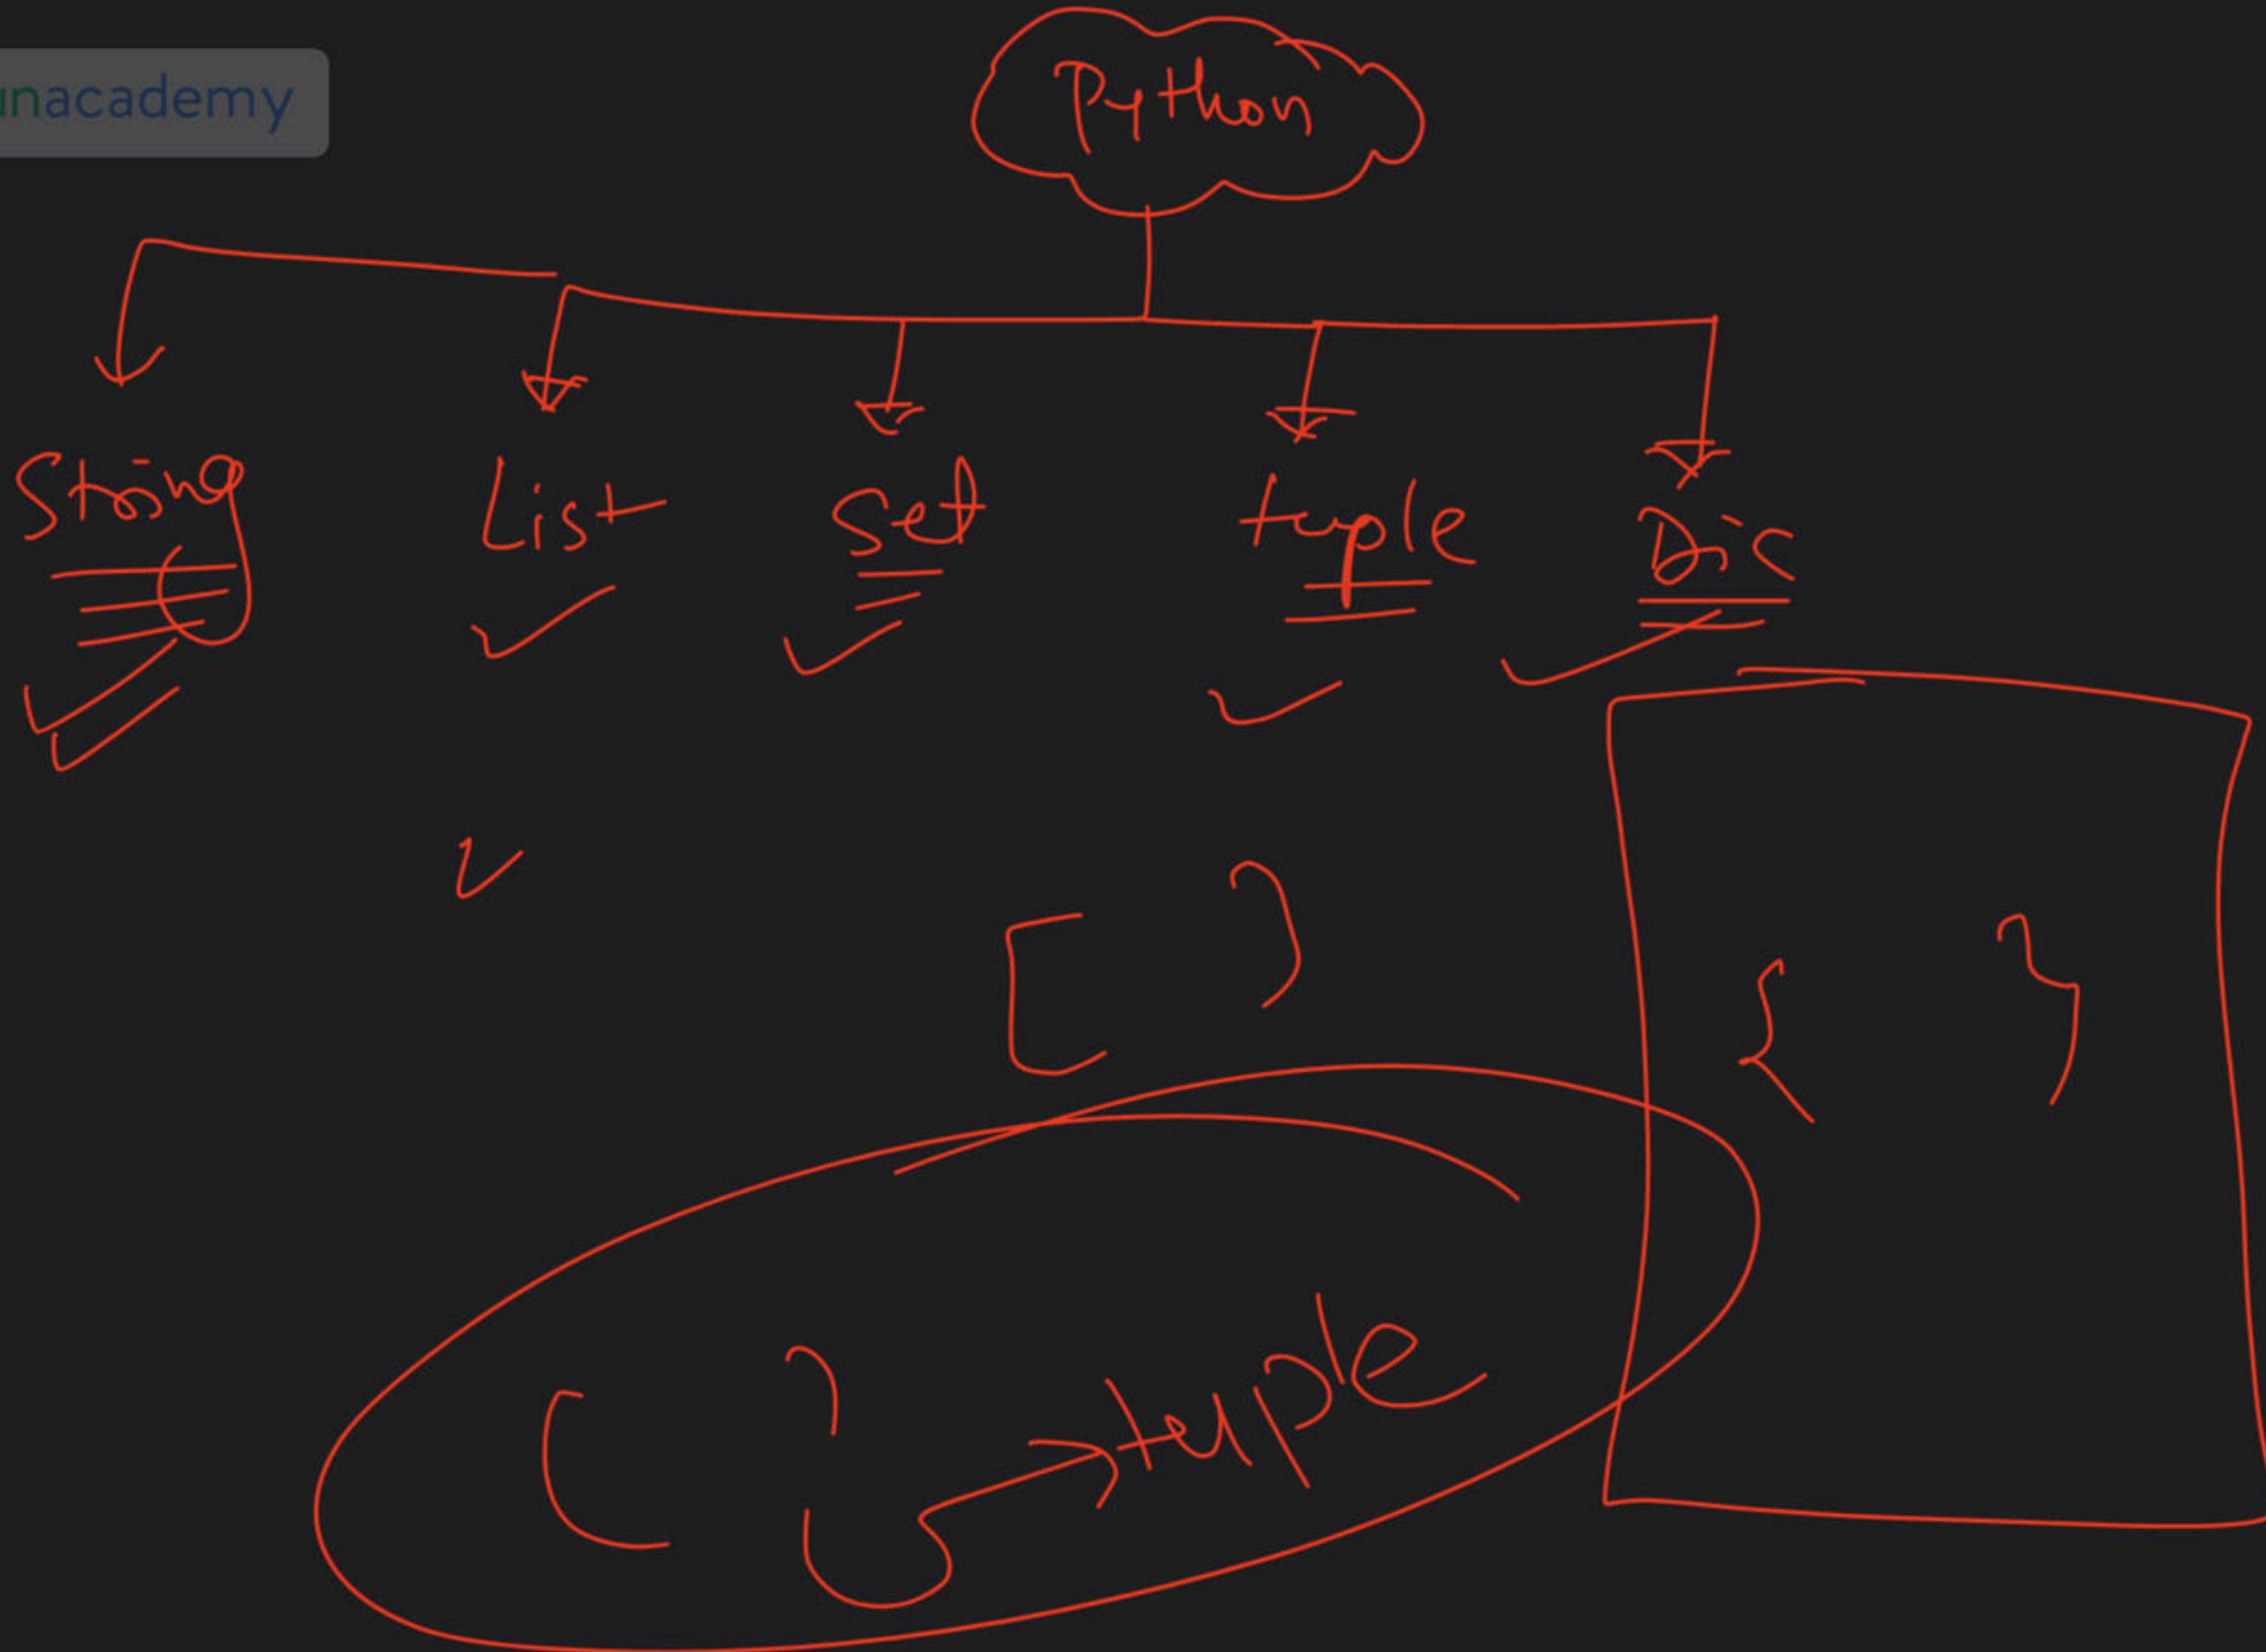

$A \cup B$   
 $A \cap B$   
 $A - B$   
 $A \Delta B$

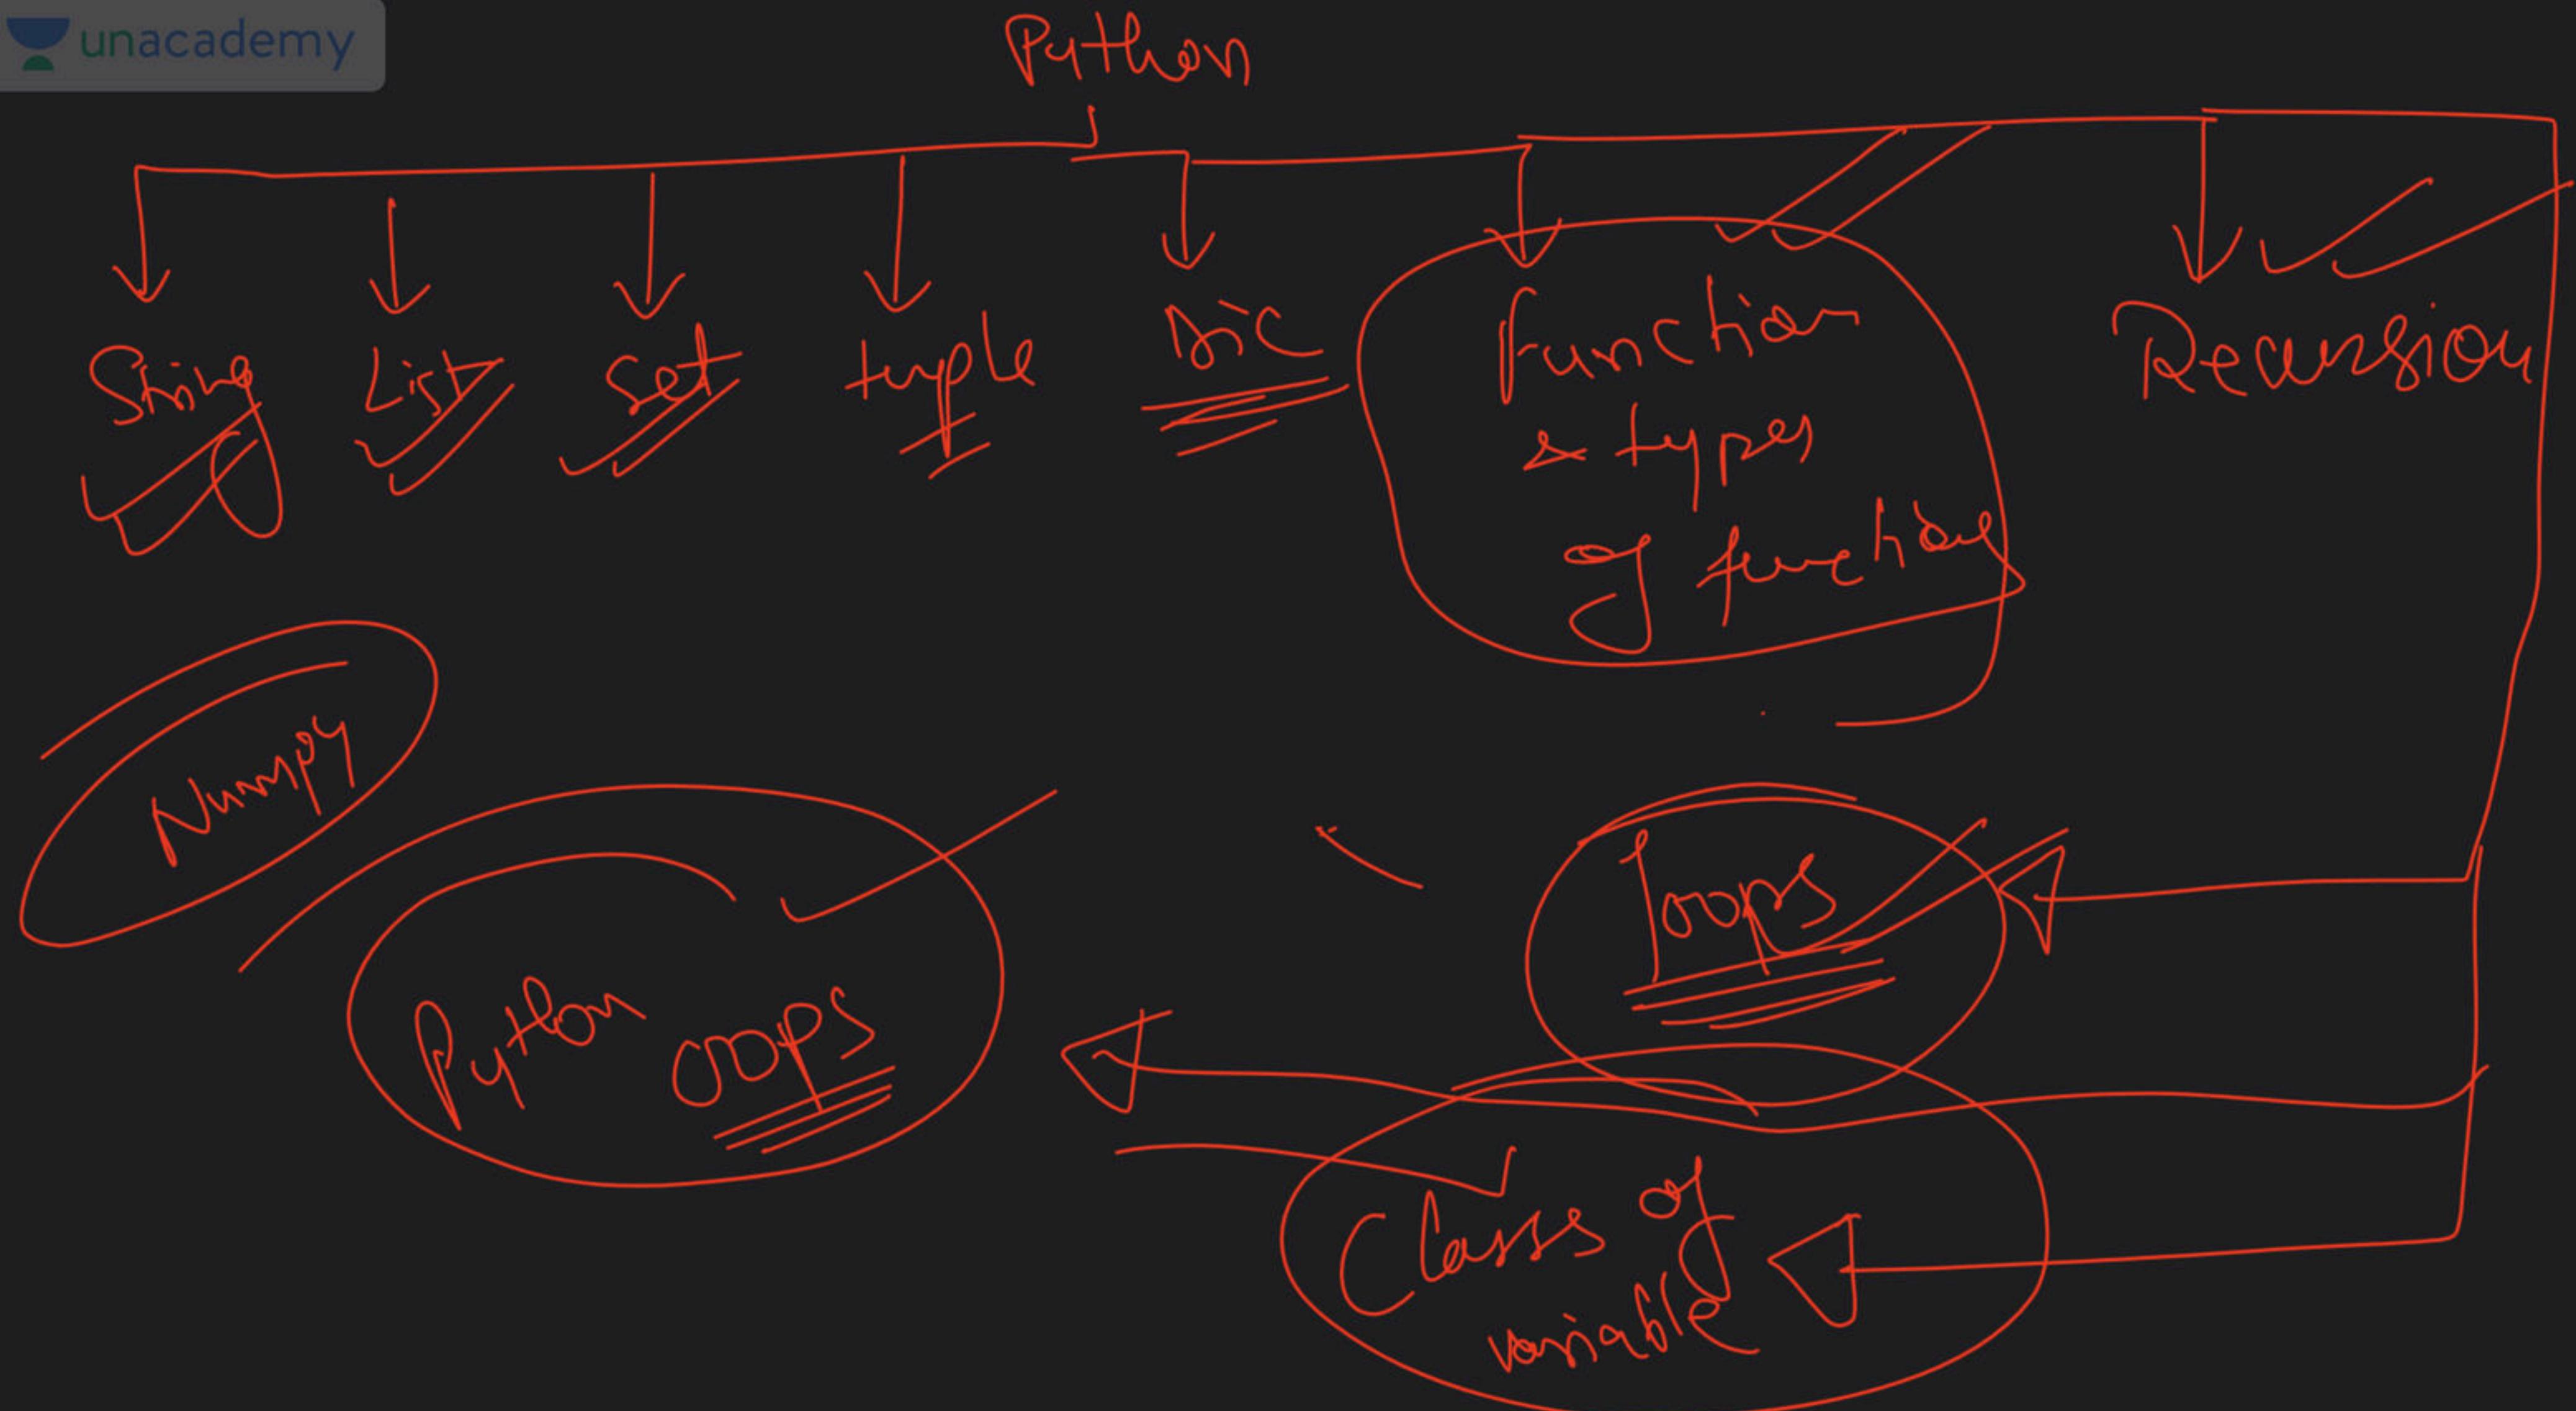

$A \Delta B \Rightarrow \{1, 2, 5, 6\}$

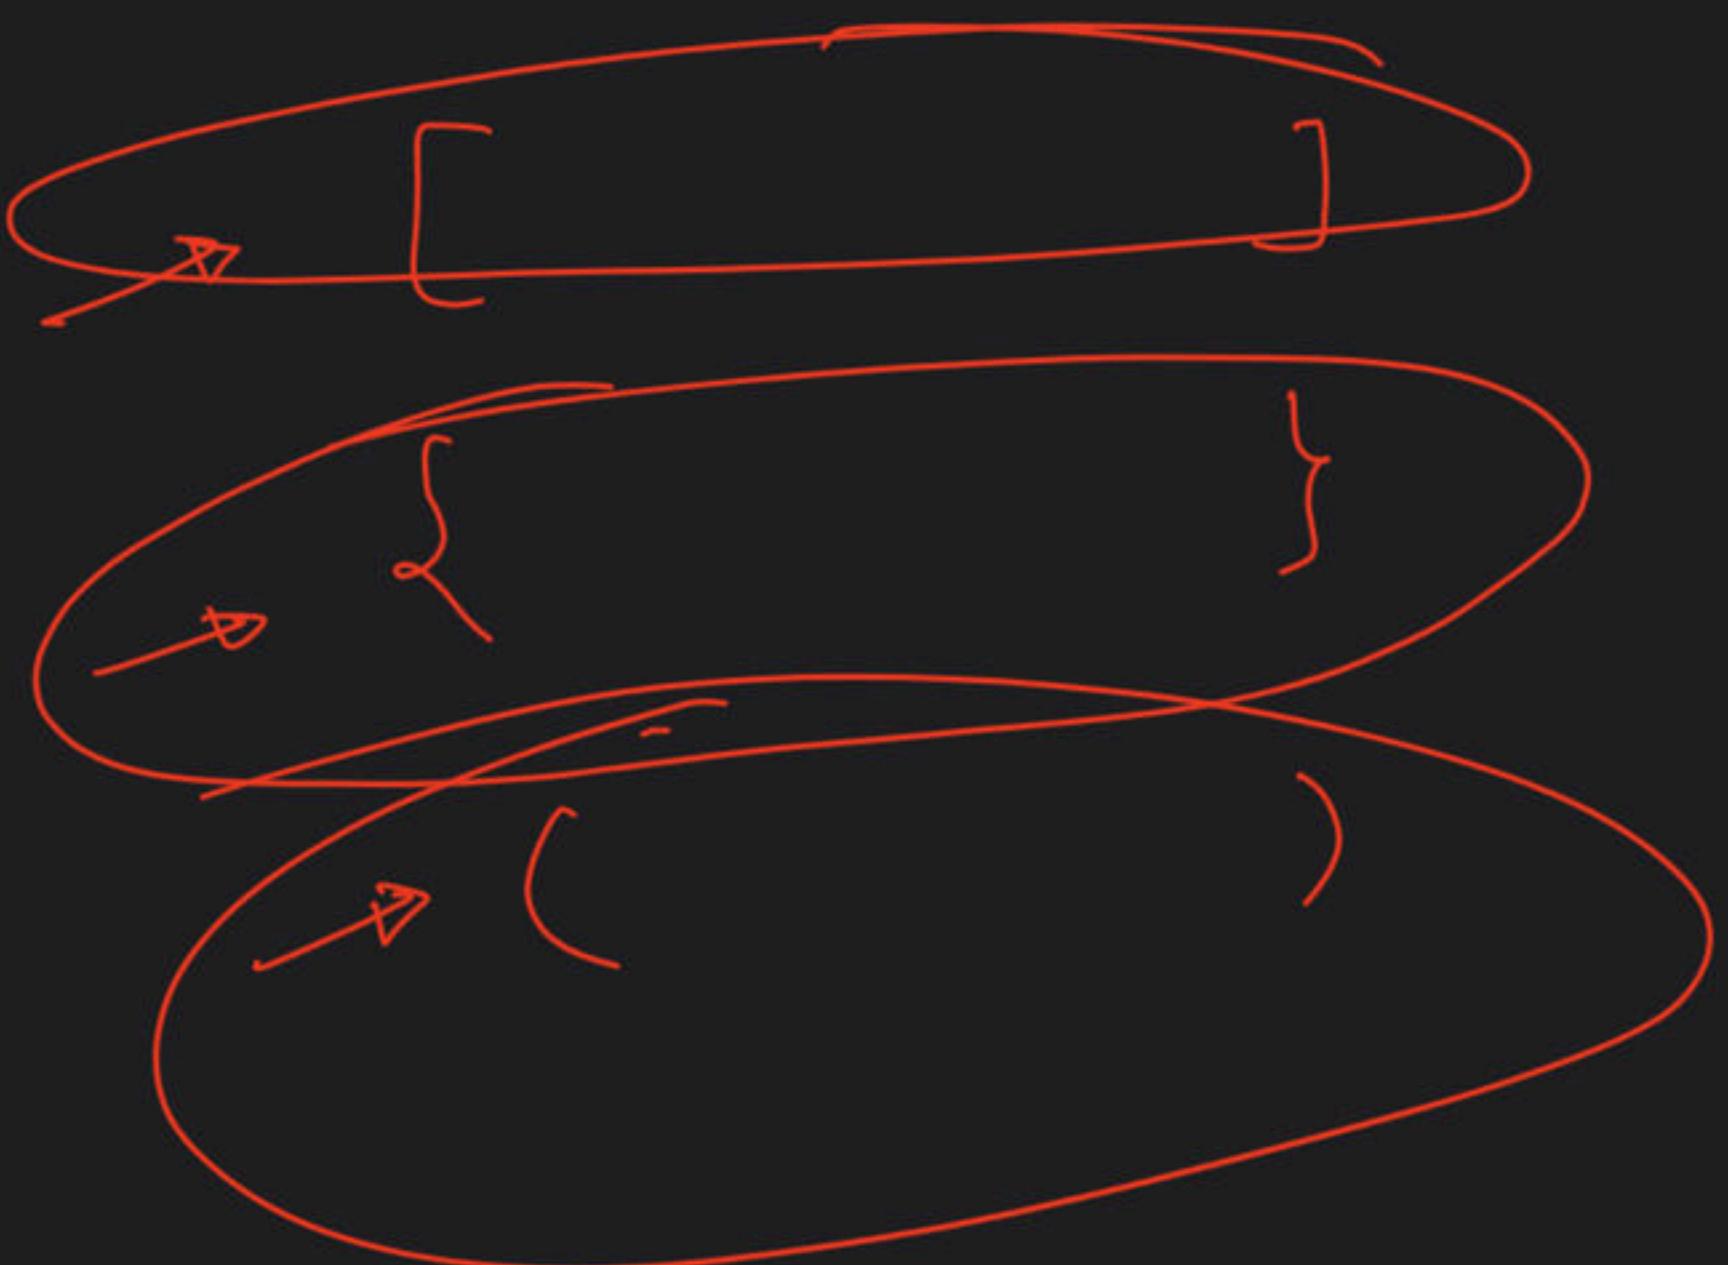

# Set Methods

In python, several built-in methods are available.

Method Name	Description
① <a href="#"><u>add()</u></a>	Adds an element to the set ✓
② <a href="#"><u>clear()</u></a>	Removes all the elements from the set ✓
③ <a href="#"><u>copy()</u></a>	Returns a copy of the set ✓
④ <a href="#"><u>difference()</u></a>	Returns a set containing the difference between two or more sets
⑤ <a href="#"><u>difference_update()</u></a>	Removes the items in this set that are also included in another, specified set
⑥ <a href="#"><u>discard()</u></a>	Remove the specified item
⑦ <a href="#"><u>intersection()</u></a>	Returns a set, that is the intersection of two other sets
⑧ <a href="#"><u>intersection_update()</u></a>	Removes the items in this set that are not present in other, specified set(s)
⑨ <a href="#"><u>isdisjoint()</u></a>	Returns whether two sets have a intersection or not
⑩ <a href="#"><u>issubset()</u></a>	Returns whether another set contains this set or not
⑪ <a href="#"><u>issuperset()</u></a>	Returns whether this set contains another set or not

# Set Methods

In python, several built-in methods are available.

Method Name	Description
<a href="#"><u>pop()</u></a>	Removes an element from the set
<a href="#"><u>remove()</u></a>	Removes the specified element
<a href="#"><u>symmetric_difference()</u></a>	Returns a set with the symmetric differences of two sets
<a href="#"><u>symmetric_difference_update()</u></a>	inserts the symmetric differences from this set and another
<a href="#"><u>union()</u></a>	Return a set containing the union of sets
<a href="#"><u>update()</u></a>	Update the set with the union of this set and others

# Set Methods

## isdisjoint( ):

```
A={12,4,5,18,25,16,30}
```

```
B={25,12,2,18}
```

```
z = A.isdisjoint(B)
```

```
print(z)
```

→ false

$$\begin{array}{l} A \rightarrow \{1, 2, 3\} \\ B \rightarrow \{4, 5, 6\} \\ \cap = \emptyset \end{array}$$

## issubset( ):

```
A={12,4,5,18,25,16,30}
```

```
B={25,12,2,18}
```

```
z = A.isdisjoint(B)
```

```
print(z)
```

→ false

$$\begin{array}{l} z = B.isdisjoint(A) \\ A = \{1, 2, 3\} \\ B = \{3, 4, 5\} \end{array}$$

## issuperset( ):

```
A={12,4,5,18,25,16,30}
```

```
B={25,12,2,18}
```

```
z = A.issuperset(B)
```

→ false

```
print(z)
```

A ⊈ B  
B ⊈ A

$$A = \{1, 2, 3, 4\}$$

$$B = \{2, 3, 4, 5, 1, 6\}$$

$$z = A.\underline{\text{issuperset}}(B)$$

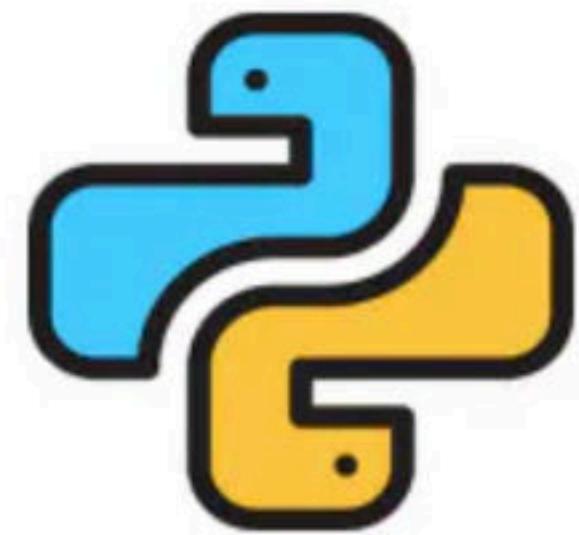

① Point(z) → False

$$z = B.\underline{\text{issuperset}}(A)$$

② Point(z) True

③  $z = A.\text{issubset}(B)$   
Print(z) True

④  $z = B.\text{issubset}(A)$   
Print(z) False

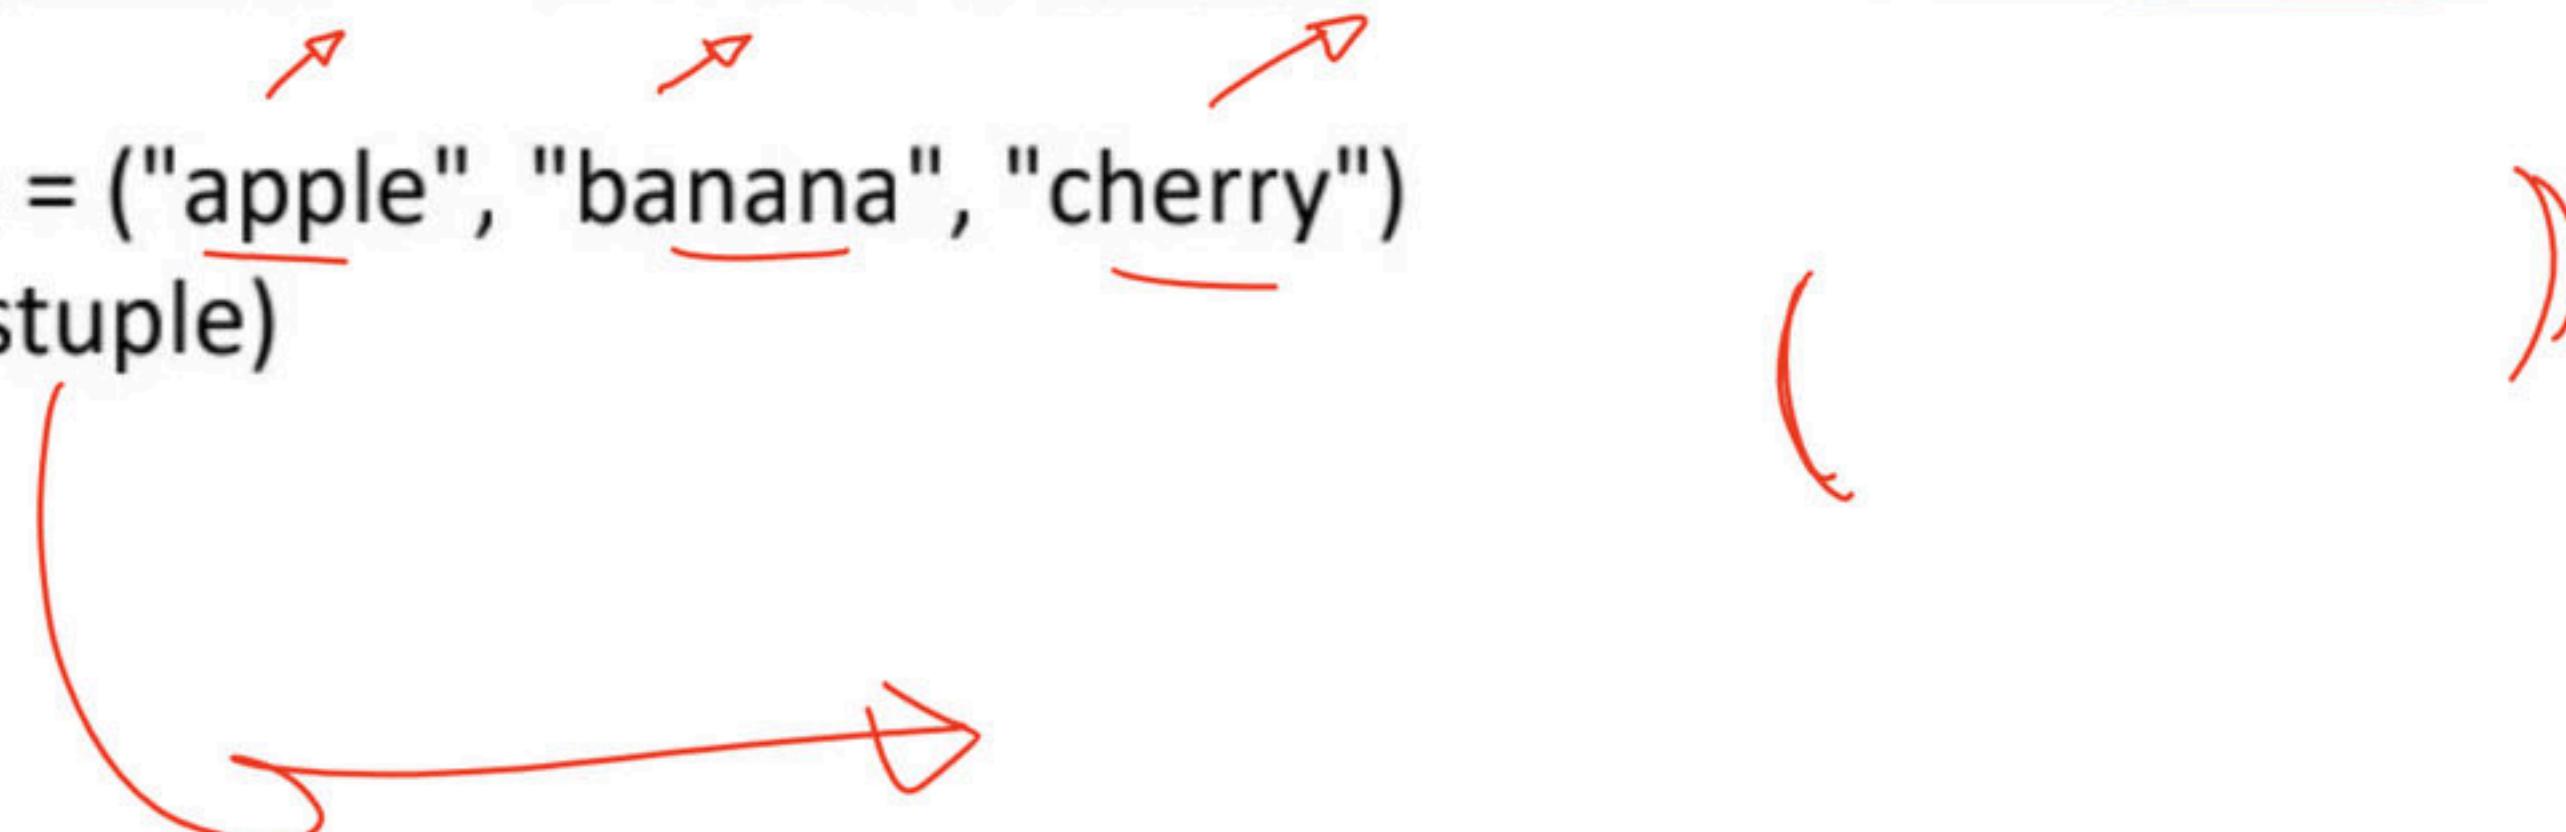

# Python Programming

Python Collections (Tuple and Dictionary)

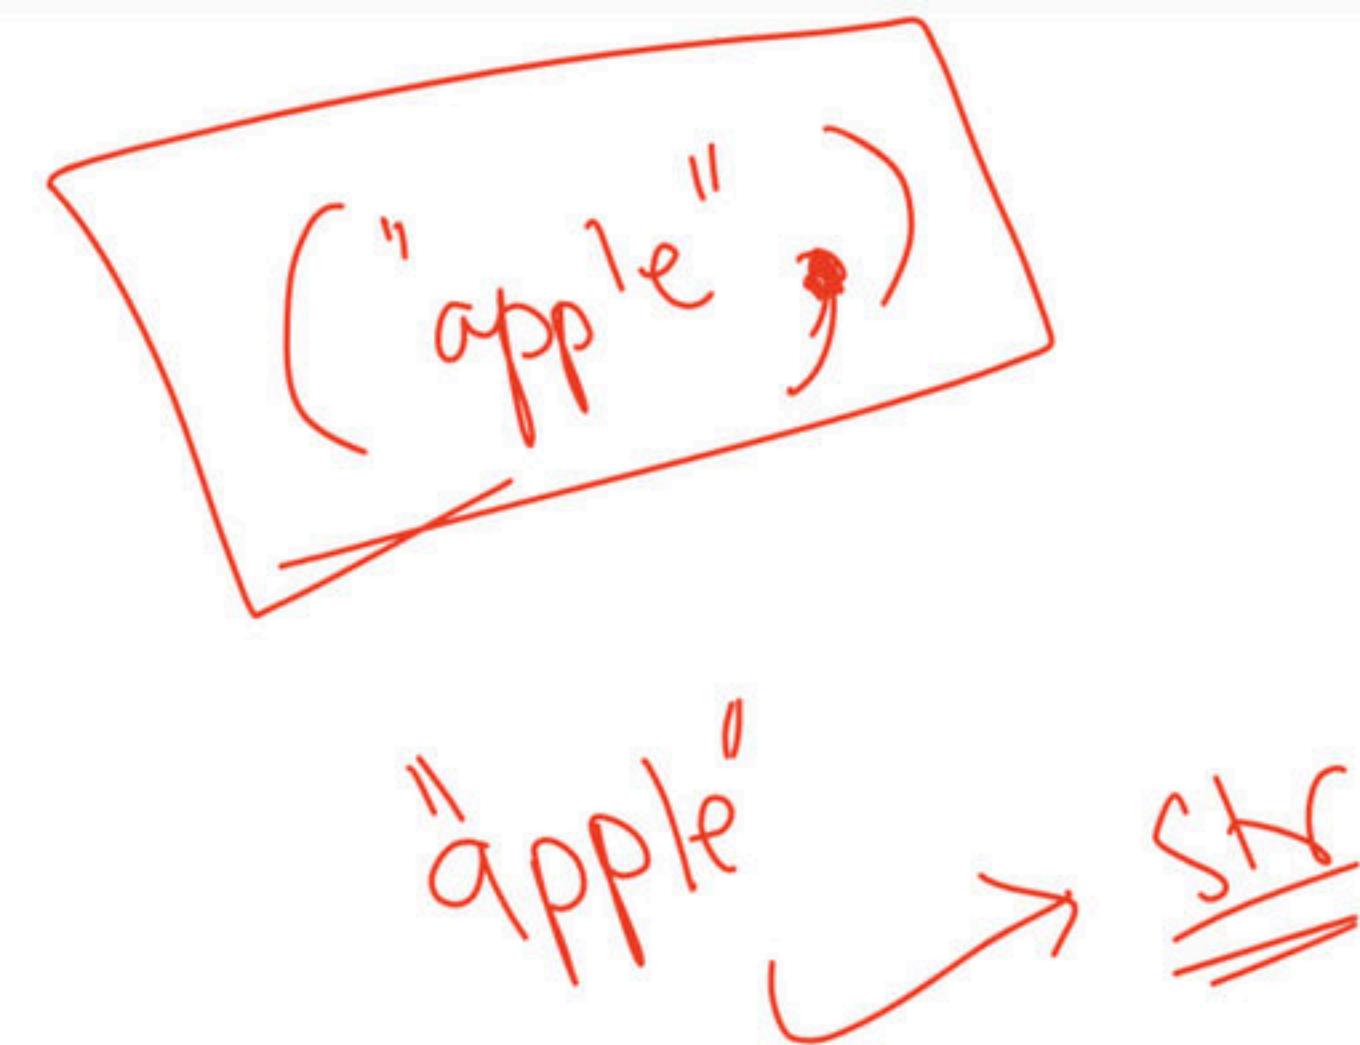

- Tuples are used to store multiple items in a single variable.
- Tuple is one of 4 built-in data types in Python used to store collections of data, the other 3 are List, Set, and Dictionary, all with different qualities and usage.
- A tuple is a collection which is ordered and unchangeable.
- Tuple items are ordered, unchangeable, and allow duplicate values.
- Tuples are written with round brackets.

```
thistuple = ("apple", "banana", "cherry")
print(thistuple)
```

To determine how many items a tuple has, use the `len()` function:

```
thistuple = ("apple", "banana", "cherry")
print(len(thistuple))
```

➤ To create a tuple with only one item, you have to add a comma after the item, otherwise Python will not recognize it as a tuple.

```
thistuple = ("apple",)
print(type(thistuple))
```

10 → int

#NOT a tuple
thistuple = ("apple")
print(type(thistuple))

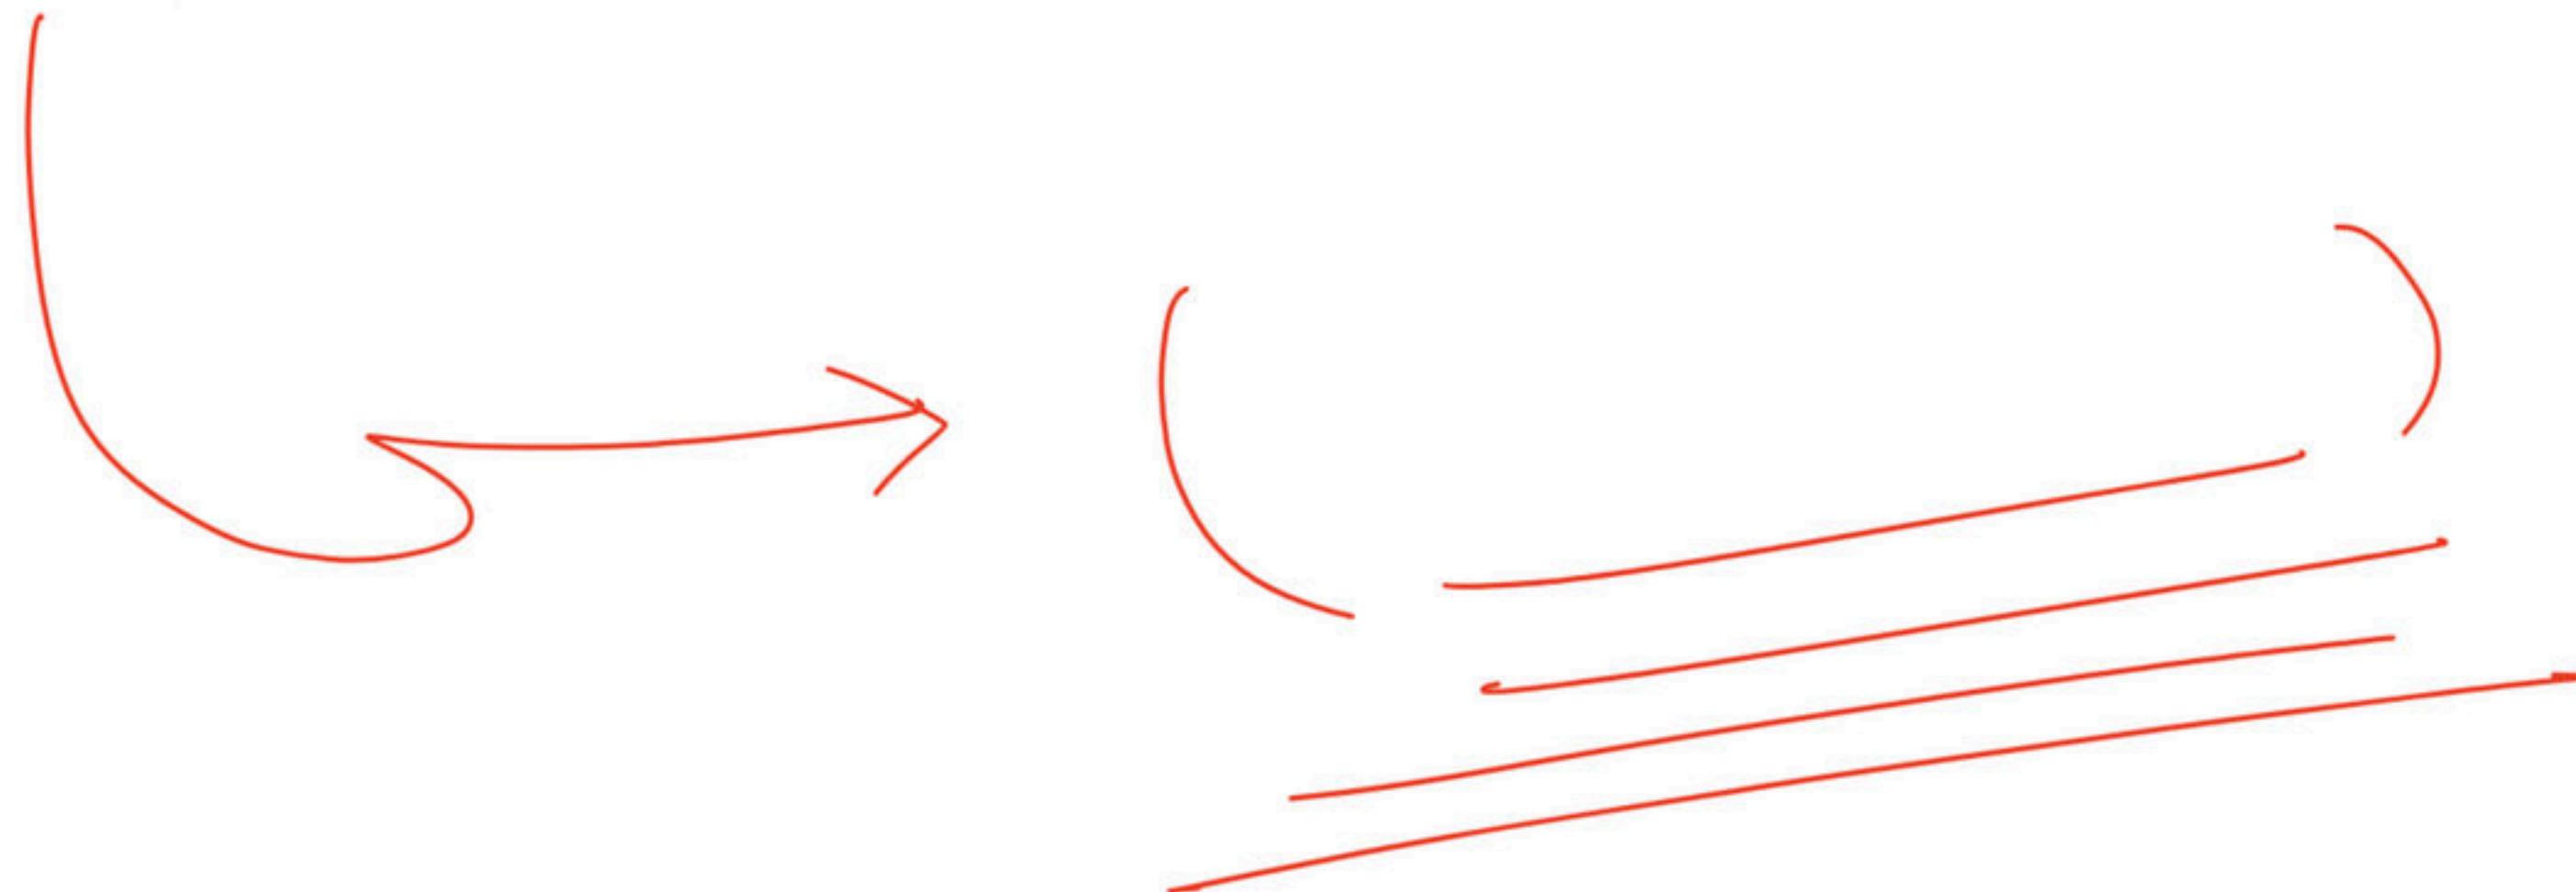

```
tuple1 = ("apple", "mango", "cherry") ✓  
tuple2 = (1, 2, 3, 4, 5) ✓  
tuple3 = (True, False, False) ✓  
tuple4 = ("xyz", 34, True, 40, "female") ✓
```

From Python's perspective, tuples are defined as objects with the data type 'tuple':

```
print(type(tuple1)) }  
print(type(tuple2)) }  
print(type(tuple3)) }  
print(type(tuple4)) }
```

## tuple() Constructor

```
thistuple = tuple(("apple", "banana", "cherry")) # note the double round-brackets  
print(thistuple)
```

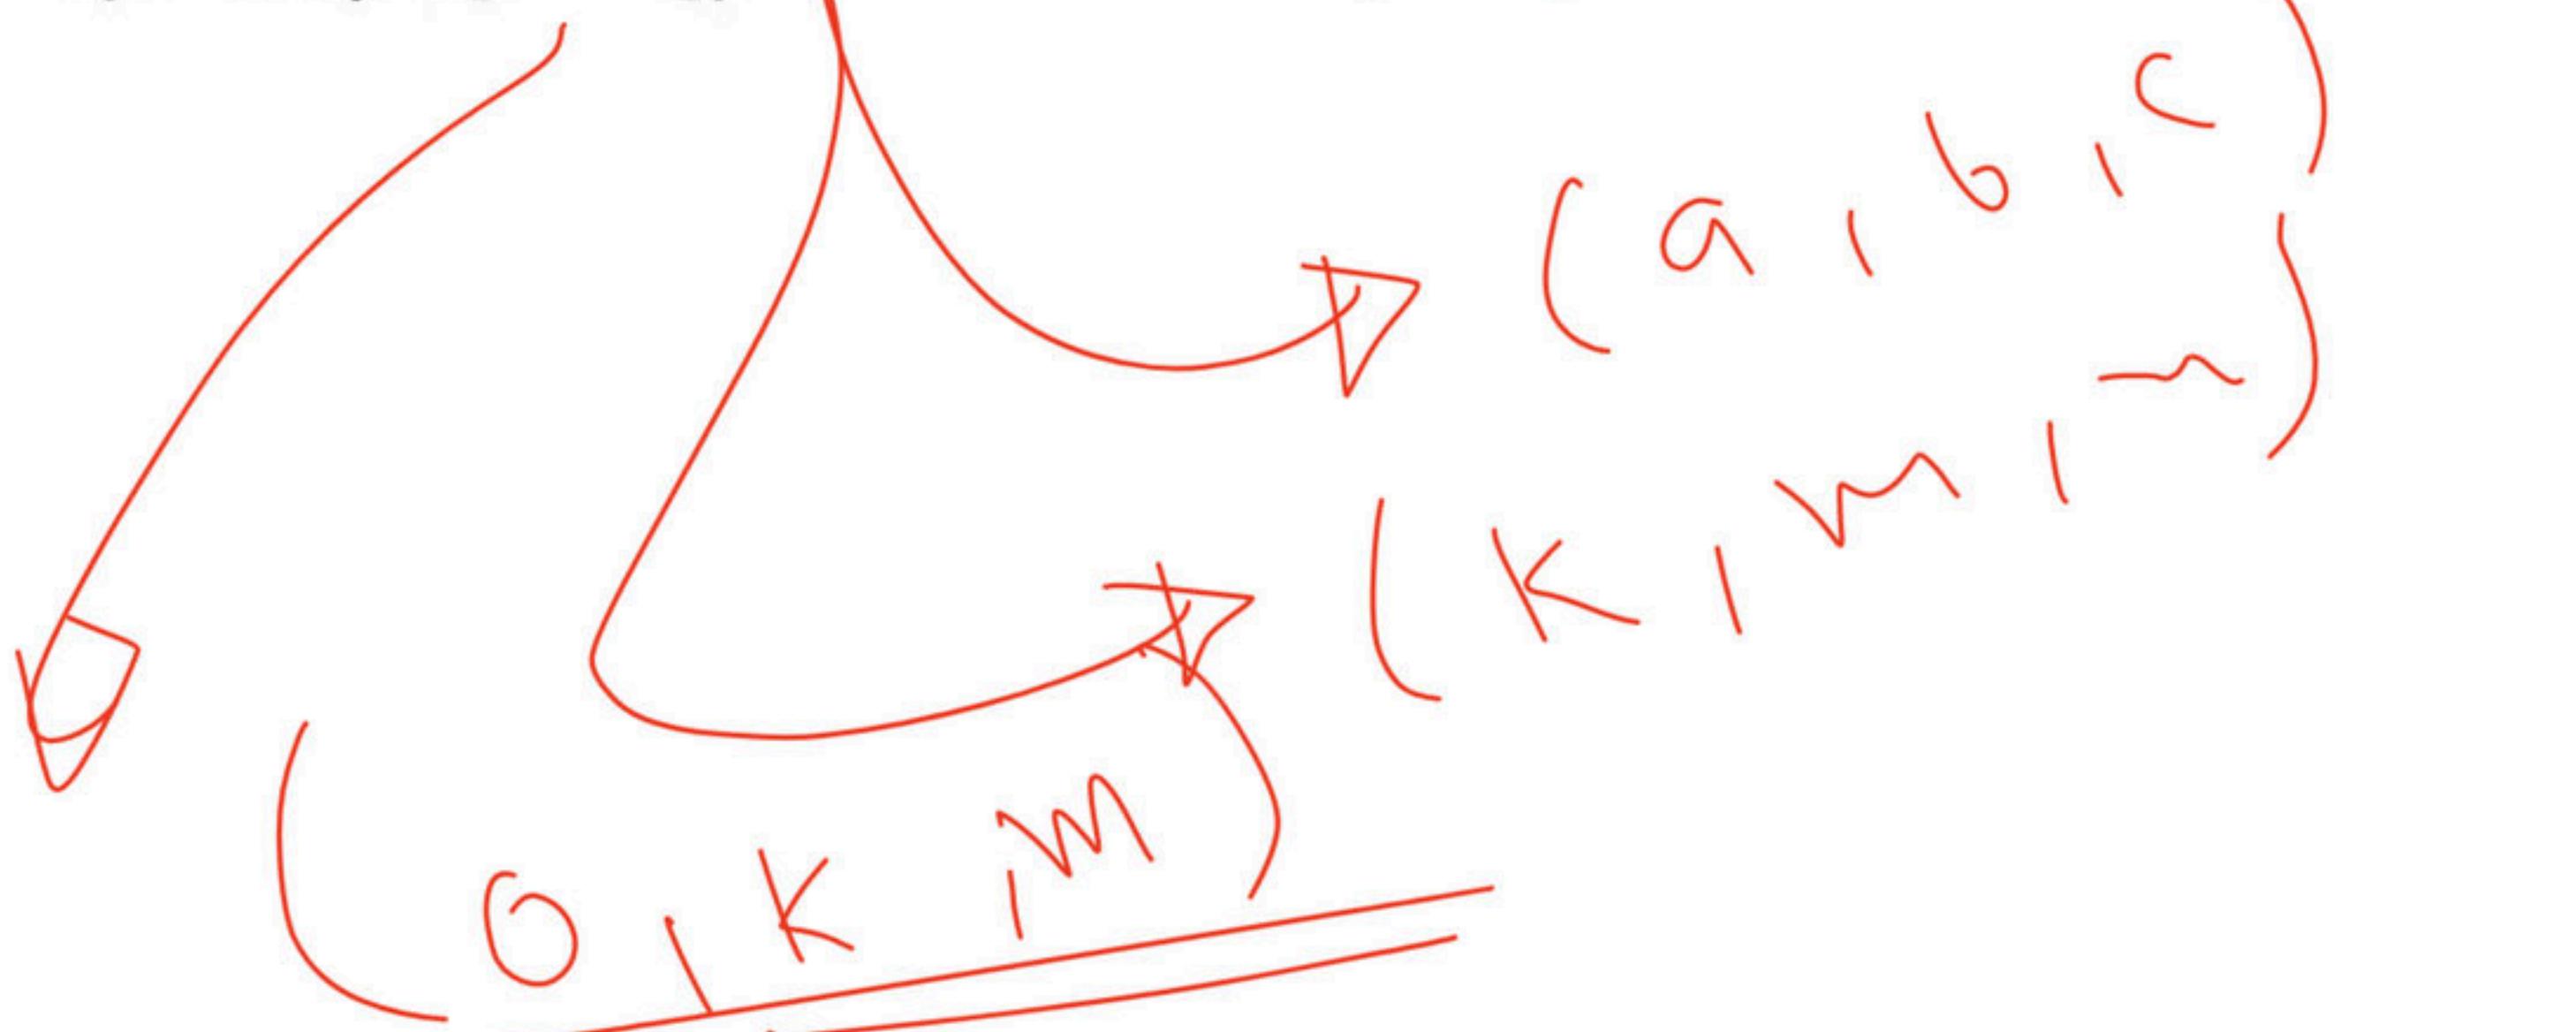

t = ( - - - - - )

t = tuple (( ))

```
thistuple = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")
```

- 1 print(thistuple[1]) → (banana)
- 2 print(thistuple[-1])
- 3 print(thistuple[2:5]) → man
- 4 print(thistuple[:3])
- 5 print(thistuple[4:])
- 6 print(thistuple[-4:-1])

```
thistuple = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")
if "apple" in thistuple:
    print("Yes, 'apple' is in the fruits tuple")
```

### Change Tuple Values

Once a tuple is created, you cannot change its values. Tuples are **unchangeable**, or **immutable** as it also is called. But there is a workaround. You can convert the tuple into a list, change the list, and convert the list back into a tuple.

```
x = ("apple", "banana", "cherry", "orange")
y = list(x)
y[1] = "kiwi"
x = tuple(y)
print(x)
```

*y = [ " - " , " - " , " - " , " - " ]*

## Add Items

Since tuples are immutable, they do not have a built-in append() method, but there are other ways to add items to a tuple.

1. **Convert into a list:** Just like the workaround for *changing* a tuple, you can convert it into a list, add your item(s), and convert it back into a tuple.

```
thistuple = ("apple", "banana", "cherry")  
y = list(thistuple)  
y.append("orange")  
thistuple = tuple(y)
```

2. **Add tuple to a tuple.** You are allowed to add tuples to tuples, so if you want to add one item, (or many), create a new tuple with the item(s), and add it to the existing tuple:

```
thistuple = ("apple", "banana", "cherry")  
y = ("orange",)  
thistuple += y  
print(thistuple)
```

thistuple  
↳ Concatenation

List

List. append ()

List ()

Tuples are **unchangeable**, so you cannot remove items from it, but you can use the same workaround as we used for changing and adding tuple items:

```
thistuple = ("apple", "banana", "cherry")
y = list(thistuple)
y.remove("apple")
thistuple = tuple(y)
```

```
thistuple = ("apple", "banana", "cherry")
del thistuple
print(thistuple) #this will raise an error because the tuple no longer exists
```

## Unpacking a Tuple

When we create a tuple, we normally assign values to it. This is called "packing" a tuple:

```
fruits = ("apple", "banana", "cherry")
```

But, in Python, we are also allowed to extract the values back into variables. This is called "unpacking":

```
fruits = ("apple", "banana", "cherry")
```

```
(green, yellow, red) = fruits
```

```
print(green)
```

```
print(yellow)
```

```
print(red)
```

green, yellow, red

(green, yellow, red) = fruits

You can do  
the unpacking with  
Set also but  
if assign random  
values.

$$S = \{1, 2, 3\}$$

$$(x, y, z) = S$$

$$x, y, z = S$$

$$y^z$$

$$z^y$$

$$x^y \cdot y^z \cdot z^x$$

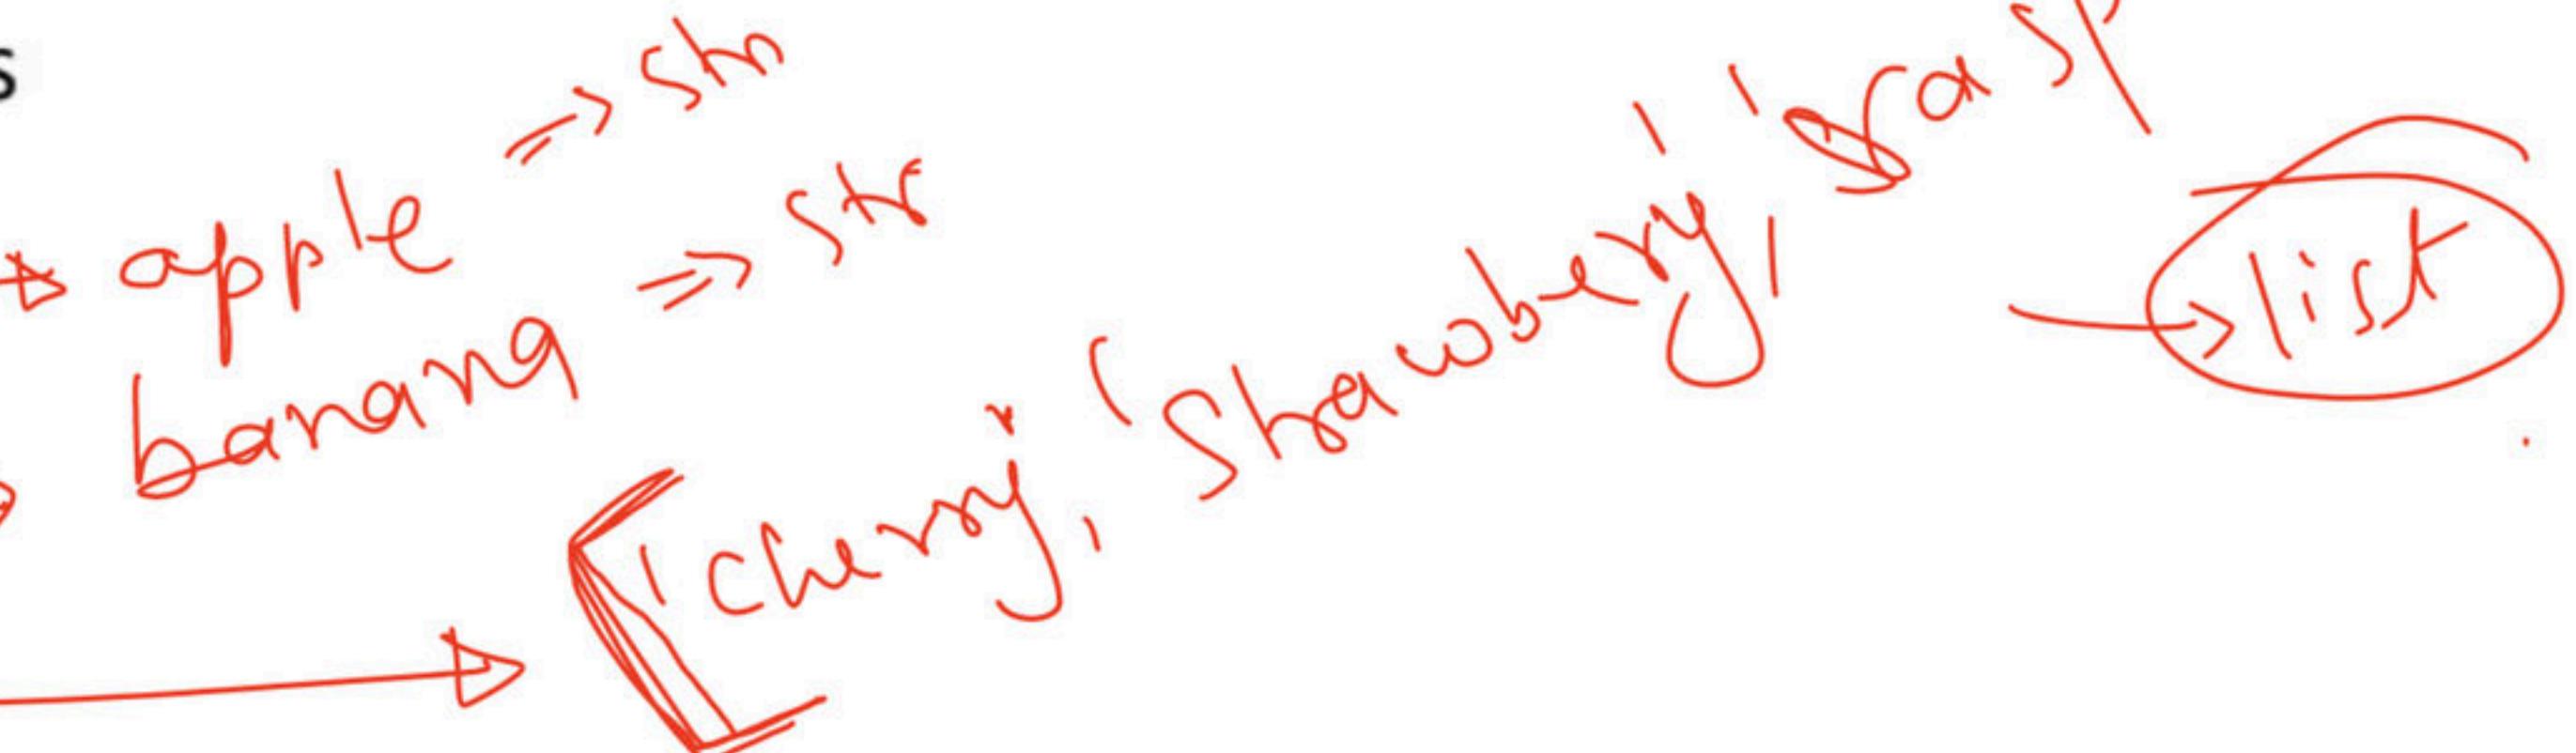

fruits = ("apple", "banana", "cherry", "strawberry", "raspberry")

(green, yellow, \*red) = fruits

print(green)

print(yellow)

print(red)

fruits = ("apple", "mango", "papaya", "pineapple", "cherry")

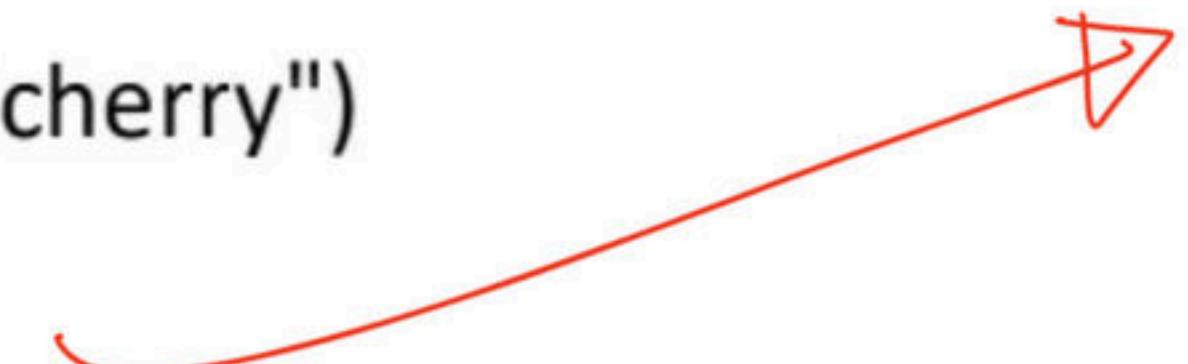

(green, \*tropic, red) = fruits

print(green)

print(tropic)

print(red)

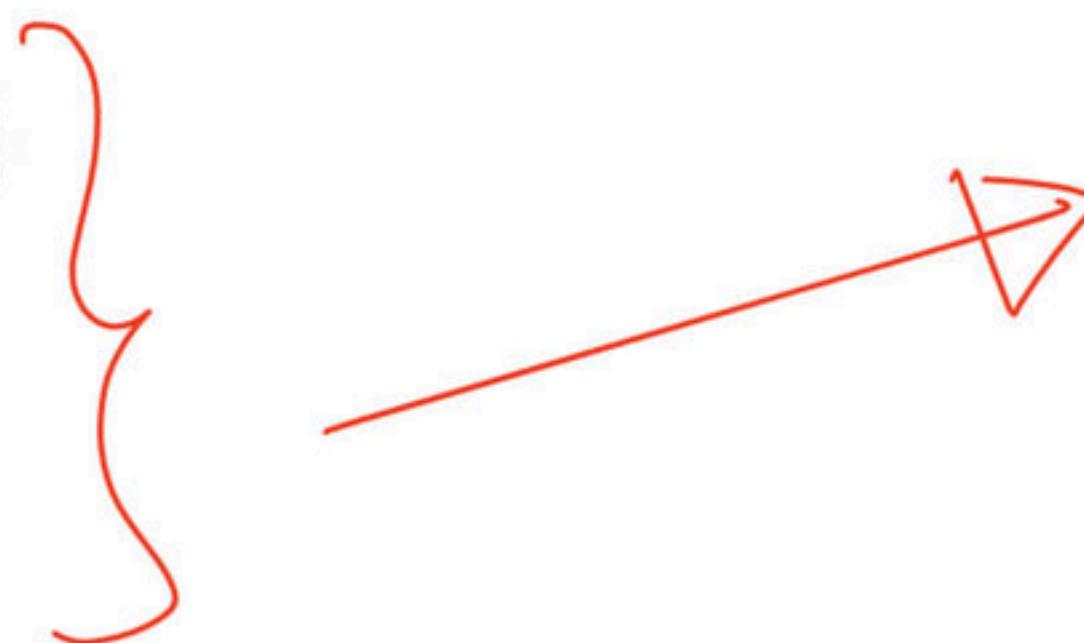

```
t= ("apple", "banana", "cherry")
for x in t:
    print(x)
```

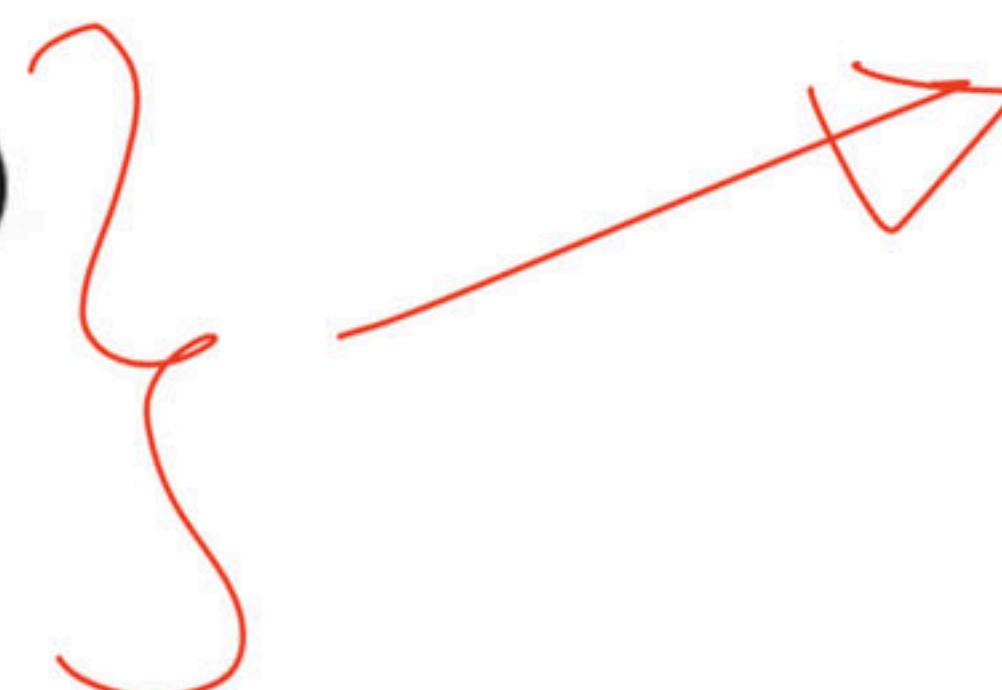

```
t = ("apple", "banana", "cherry")
for i in range(len(t)):
    print(t[i])
```

```
t = ("apple", "banana", "cherry")
i = 0
while i < len(t):
    print(t[i])
    i = i + 1
```

```
t1 = ("a", "b", "c")  
t2 = (1, 2, 3)  
t3 = t1 + t2  
print(t3)
```

```
fruits = ("apple", "banana", "cherry")  
mytuple = fruits * 2  
print(mytuple)
```

 *unacademy* → 10  
thistuple = (1, 3, 7, 8, 7, 5, 4, 6, 8, 5)  
x = thistuple.count(5)  
print(x)

0, ~3  
thistuple = (1, 3, 7, 8, 7, 5, 4, 6, 8, 5)  
x = thistuple.index(8)  
print(x)

thistuple = { 1, 3, 7, 8, 7, 5, 4, 6, 8, 5 }  
x = thistuple.count(5) → index()  
in const of set  
give Export

The index() method finds the first occurrence of the specified value.  
The index() method raises an exception if the value is not found.

There are four collection data types in the Python programming language:

**List** is a collection which is ordered and changeable. Allows duplicate members.

**Tuple** is a collection which is ordered and unchangeable. Allows duplicate members.

**Set** is a collection which is unordered, unchangeable\*, and unindexed. No duplicate members.

**Dictionary** is a collection which is ordered\*\* and changeable. No duplicate members.

\*Set *items* are unchangeable, but you can remove and/or add items whenever you like.

\*\*As of Python version 3.7, dictionaries are *ordered*. In Python 3.6 and earlier, dictionaries are *unordered*.

Thank You...
